

MEMS digital output dual motion and temperature sensor

Features

- Ultra-low power consumption: 50 nA in power-down mode, below 1 μ A in active low-power mode
- Very low noise: down to 1.3 mg RMS in low-power mode
- 0.8 $^{\circ}$ C (typ. accuracy) embedded temperature sensor
- Multiple operating modes with multiple bandwidths
- Android stationary detection, motion detection
- Supply voltage, 1.62 V to 3.6 V
- Independent IO supply
- $\pm 2g/\pm 4g/\pm 8g/\pm 16g$ full scale
- High-speed I²C/SPI digital output interface
- Single data conversion on demand
- 16-bit accelerometer data output
- 12-bit temperature data output
- Self-test
- 32-level FIFO
- 10000 g high shock survivability
- [ECOPACK](#), RoHS and “Green” compliant

Applications

- Fragile shipment tracking
- Motion and temperature monitoring in battery-powered devices
- Gesture recognition and gaming
- Motion-activated functions and user interfaces
- Display orientation
- Tap/double-tap recognition
- Free-fall detection
- Smart power saving for handheld devices
- Hearing aids
- Portable healthcare devices
- Wireless sensor nodes
- Motion-enabled metering devices

Description

The [LIS2DTW12](#) is an ultra-low-power high-performance three-axis linear accelerometer and temperature sensor belonging to the “femto” family which leverages on the robust and mature manufacturing processes already used for the production of micromachined accelerometers.

The device has user-selectable full scales of $\pm 2g/\pm 4g/\pm 8g/\pm 16g$ and is capable of measuring accelerations with output data rates from 1.6 Hz to 1600 Hz.

The LIS2DTW12 has an embedded 0.8 $^{\circ}$ C (typ. accuracy) temperature sensor with ODRs ranging from 50 to 1.6 Hz and resolution from 8 to 12 bits.

Product status link	
LIS2DTW12	
Product summary	
Order code	LIS2DTW12TR
Temperature range [$^{\circ}$ C]	-40 to +85
Package	LGA-12
Packing	Tape and reel
Product label	
	

The LIS2DTW12 has an integrated 32-level first-in, first-out (FIFO) buffer allowing the user to store data in order to limit intervention by the host processor.

The embedded self-test capability allows the user to check the functioning of the sensor in the final application.

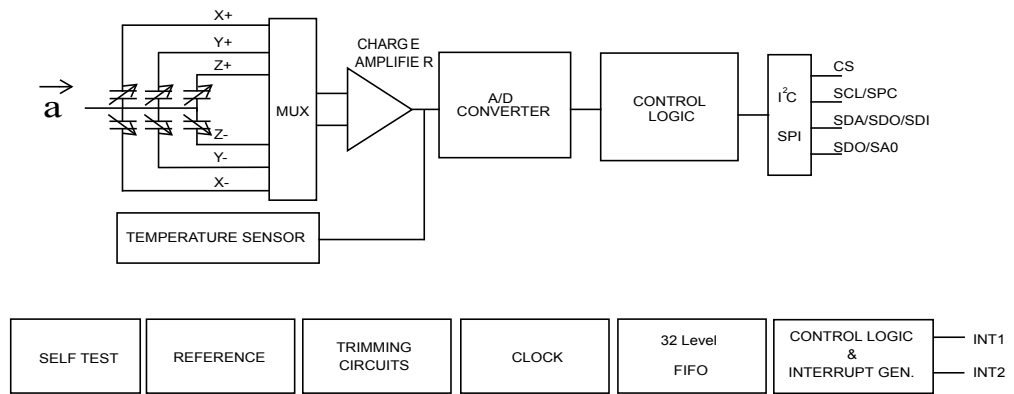

The device has a dedicated internal engine to process motion and acceleration detection including free-fall, wakeup, highly configurable single/double-tap recognition, activity/inactivity, stationary/motion detection, portrait/landscape detection and 6D/4D orientation.

The LIS2DTW12 is available in a small thin plastic land grid array package (LGA) and it is guaranteed to operate over an extended temperature range from -40 °C to +85 °C.

1 Block diagram and pin description

1.1 Block diagram

Figure 1. Block diagram

1.2 Pin description

Figure 2. Pin connections

Table 1. Pin description

Pin#	Name	Function
1	SCL SPC	I ² C serial clock (SCL) SPI serial port clock (SPC)
2 ⁽¹⁾	CS	SPI enable I ² C/SPI mode selection (1: SPI idle mode / I ² C communication enabled; 0: SPI communication mode / I ² C disabled)
3 ⁽¹⁾	SDO SA0	SPI serial data output (SDO) I ² C less significant bit of the device address (SA0)
4	SDA SDI SDO	I ² C serial data (SDA) SPI serial data input (SDI) 3-wire interface serial data output (SDO)
5	NC	Internally not connected. Can be tied to VDD, VDDIO, or GND.
6	GND	0 V supply
7	RES	Connect to GND
8	GND	0 V supply
9	VDD	Power supply
10	VDD_IO	Power supply for I/O pins
11	INT2	Interrupt pin 2. Clock input when selected in single data conversion on demand.
12	INT1	Interrupt pin 1

1. SDO/SA0 and CS pins are internally pulled up. Refer to Table 2. Internal pull-up values (typ.) for SDO/SA0 and CS pins for the internal pull-up values (typ).

Table 2. Internal pull-up values (typ.) for SDO/SA0 and CS pins

Vdd_IO	Resistor value for SDO/SA0 and CS pins	
	Typ. (kΩ)	
1.7 V	54.4	
1.8 V	49.2	
2.5 V	30.4	
3.6 V	20.4	

2 Mechanical and electrical specifications

2.1 Mechanical characteristics

@ Vdd = 1.8 V, T = 25 °C unless otherwise noted. The product is factory calibrated at 1.8 V. The operational power supply range is from 1.62 V to 3.6 V.

Table 3. Mechanical characteristics

Symbol	Parameter	Test conditions	Min.	Typ. ⁽¹⁾	Max.	Unit
FS	Measurement range			±2		g
				±4		
				±8		
				±16		
So	Sensitivity	@ FS ±2 g in High-Performance Mode and all low-power modes except Low-Power Mode 1		0.244		mg/digit
		@ FS ±4 g in High-Performance Mode and all low-power modes except Low-Power Mode 1		0.488		
		@ FS ±8 g in High-Performance Mode and all low-power modes except Low-Power Mode 1		0.976		
		@ FS ±16 g in High-Performance Mode and all low-power modes except Low-Power Mode 1		1.952		
		@ FS ±2 g in Low-Power Mode 1		0.976		
		@ FS ±4 g in Low-Power Mode 1		1.952		
		@ FS ±8 g in Low-Power Mode 1		3.904		
		@ FS ±16 g in Low-Power Mode 1		7.808		
An	Noise density - High-performance Mode ⁽²⁾	@ FS ±2 g		90		µg/√Hz
RMS	RMS noise - Low-Power Modes ⁽³⁾ @ FS ±2 g	Low-Power Mode 4		1.3		mg(RMS)
		Low-Power Mode 3		1.8		
		Low-Power Mode 2		2.4		
		Low-Power Mode 1		4.5		
TyOff	Zero-g level offset accuracy ⁽⁴⁾			±20		mg
TCO	Zero-g offset change vs. temperature			±0.2		mg/°C
TCS	Sensitivity change vs. temperature			0.01		%/°C
ST	Self-test positive difference		70		1500	mg

1. Typical specifications are not guaranteed.
2. Noise density is the same for all ODRs. Low-noise setting enabled.
3. RMS noise is the same for all ODRs. Low-noise setting enabled.
4. Values after factory calibration test and trimming.

2.2 Electrical characteristics

@ Vdd = 1.8 V, T = 25 °C unless otherwise noted. The product is factory calibrated at 1.8 V. The operational power supply range is from 1.62 V to 3.6 V.

Table 4. Electrical characteristics

Symbol	Parameter	Test conditions	Min.	Typ. ⁽¹⁾	Max.	Unit
Vdd	Supply voltage		1.62	1.8	3.6	V
Vdd_IO	I/O pins supply voltage ⁽²⁾		1.62		Vdd+0.1	V
IddHR	Current consumption in High-Performance Mode ⁽³⁾	@ ODR range 12.5 Hz - 1600 Hz, 14-bit		90		μA
IddLP	Current consumption in Low-Power Mode ⁽⁴⁾	ODR 100 Hz		5		μA
		ODR 50 Hz		3		
		ODR 12.5 Hz		1		
		ODR 1.6 Hz		0.38		
Idd_PD	Current consumption in power-down			50		nA
V _{IH}	Digital high-level input voltage		0.8*Vdd_IO			V
V _{IL}	Digital low-level input voltage				0.2*Vdd_IO	V
V _{OH}	Digital high-level output voltage	I _{OH} = 4 mA ⁽⁵⁾	VDD_IO - 0.2 V			V
V _{OL}	Digital low-level output voltage	I _{OL} = 4 mA ⁽⁵⁾			0.2 V	V

1. Typical specifications are not guaranteed.
2. It is possible to remove Vdd maintaining Vdd_IO without blocking the communication busses. In this condition the measurement chain is powered off.
3. Low-noise setting disabled.
4. Low-Power Mode 1. Low-noise setting disabled.
5. 4 mA is the maximum driving capability, ie. the maximum DC current that can be sourced/sunk by the digital pad in order to guarantee the correct digital output voltage levels V_{OH} and V_{OL}.

2.3 Temperature sensor characteristics

@ Vdd = 1.8 V, T = 25 °C unless otherwise noted.

Table 5. Temperature sensor characteristics

Symbol	Parameter	Min.	Typ. ⁽¹⁾	Max.	Unit
Top	Operating temperature range	-40		+85	°C
Tacc	Temperature accuracy (0 °C to 70 °C)		±0.8		°C
	Temperature accuracy (-40 °C to +85 °C)		±1.3		
TODR	Temperature refresh rate in High-Performance Mode for all ODRs or in low-power modes for ODRs equal to 200/100/50 Hz		50		Hz
	Temperature refresh rate in low-power modes for ODR equal to 25 Hz		25		
	Temperature refresh rate in low-power modes for ODR equal to 12.5 Hz		12.5		
	Temperature refresh rate in low-power modes for ODR equal to 1.6 Hz		1.6		

1. Typical specifications are not guaranteed.

2.4 Communication interface characteristics

2.4.1 SPI - serial peripheral interface

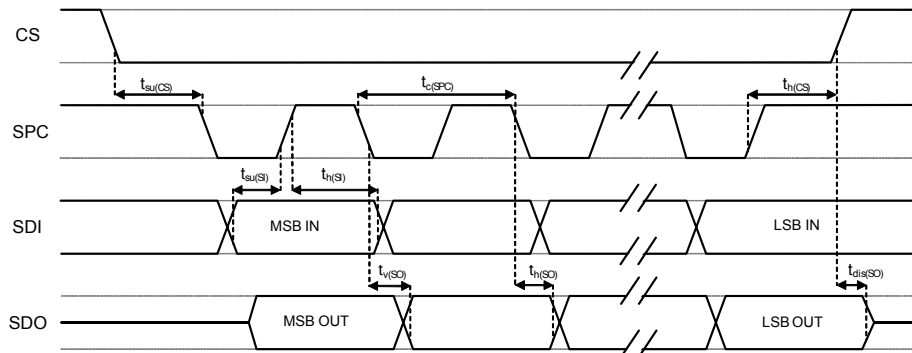

Subject to general operating conditions for Vdd and Top.

Table 6. SPI slave timing values

Symbol	Parameter	Value ⁽¹⁾		Unit
		Min	Max	
$t_{c(SPC)}$	SPI clock cycle	100		ns
$f_{c(SPC)}$	SPI clock frequency		10	MHz
$t_{su(CS)}$	CS setup time	6		ns
$t_{h(CS)}$	CS hold time	8		
$t_{su(SI)}$	SDI input setup time	12		
$t_{h(SI)}$	SDI input hold time	15		
$t_{v(SO)}$	SDO valid output time		50	
$t_{h(SO)}$	SDO output hold time	9		
$t_{dis(SO)}$	SDO output disable time		50	

1. 10 MHz clock frequency for SPI with both 4 and 3 wires, based on characterization results, not tested in production.

Figure 3. SPI slave timing diagram

Note: Measurement points are done at 0.2·Vdd_IO and 0.8·Vdd_IO, for both input and output ports.

2.4.2 I²C - inter-IC control interface

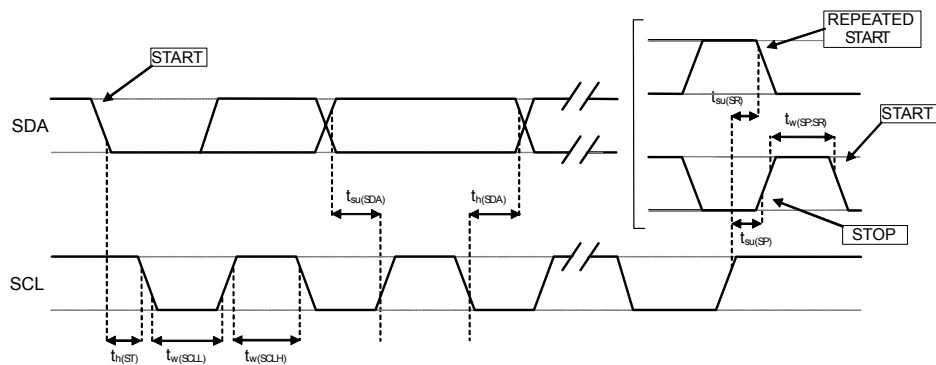

Subject to general operating conditions for V_{dd} and Top.

Table 7. I²C slave timing values

Symbol	Parameter	I ² C standard mode ⁽¹⁾		I ² C fast mode ⁽¹⁾		Unit
		Min	Max	Min	Max	
f _(SCL)	SCL clock frequency	0	100	0	400	kHz
t _{w(SCLL)}	SCL clock low time	4.7		1.3		μs
t _{w(SCLH)}	SCL clock high time	4.0		0.6		
t _{su(SDA)}	SDA setup time	250		100		ns
t _{h(SDA)}	SDA data hold time	0.01	3.45	0.01	0.9	μs
t _{h(ST)}	START condition hold time	4		0.6		μs
t _{su(SR)}	Repeated START condition setup time	4.7		0.6		
t _{su(SP)}	STOP condition setup time	4		0.6		
t _{w(SP:SR)}	Bus free time between STOP and START condition	4.7		1.3		

1. Data based on standard I²C protocol requirement, not tested in production.

Figure 4. I²C slave timing diagram

Note: Measurement points are done at 0.2·V_{dd_IO} and 0.8·V_{dd_IO}, for both ports.

Table 8. I²C high-speed mode specifications at 1 MHz and 3.4 MHz

Mode	Symbol	Parameter	Min	Max	Unit	
Fast mode plus ⁽¹⁾	f _{SCL}	SCL clock frequency	0	1	MHz	
	t _{HD;STA}	Hold time (repeated) START condition	260	-	ns	
	t _{LOW}	Low period of the SCL clock	500	-		
	t _{HIGH}	High period of the SCL clock	260	-		
	t _{SU;STA}	Setup time for a repeated START condition	260	-		
	t _{HD;DAT}	Data hold time	0	-		
	t _{SU;DAT}	Data setup time	50	-		
	t _{rDA}	Rise time of SDA signal	-	120		
	t _{fDA}	Fall time of SDA signal	-	120		
	t _{rCL}	Rise time of SCL signal	20*V _{dd} /5.5	120		
	t _{fCL}	Fall time of SCL signal	20*V _{dd} /5.5	120		
	t _{SU;STO}	Setup time for STOP condition	260	-		
	C _b	Capacitive load for each bus line	-	550		pF
	t _{VD;DAT}	Data valid time	-	450		ns
	t _{VD;ACK}	Data valid acknowledge time	-	450		
	V _{nL}	Noise margin at low level	0.1V _{dd}	-	V	
	V _{nH}	Noise margin at high level	0.2V _{dd}	-		
t _{SP}	Pulse width of spikes that must be suppressed by the input filter	0	50	ns		
High-speed mode ⁽¹⁾	f _{SCLH}	SCLH clock frequency	0	3.4	MHz	
	t _{SU;STA}	Setup time for a repeated START condition	160	-	ns	
	t _{HD;STA}	Hold time (repeated) START condition	160	-		
	t _{LOW}	Low period of the SCLH clock	160	-		
	t _{HIGH}	High period of the SCLH clock	60	-		
	t _{SU;DAT}	Data setup time	10	-		
	t _{HD;DAT}	Data hold time	0	70		
	t _{rCL}	Rise time of SCLH signal	10	40		
	t _{rCL1}	Rise time of SCLH signal after a repeated START condition and after an acknowledge bit	10	80		
	t _{fCL}	Fall time of SCLH signal	10	40		
	t _{rDA}	Rise time of SDAH signal	10	80		
	t _{fDA}	Fall time of SDAH signal	10	80		
	t _{SU;STO}	Setup time for STOP condition	160	-		
	C _b	Capacitive load for each bus line	-	100		pF
	V _{nH}	Noise margin at high level	0.2V _{dd}	-		V
t _{SP}	Pulse width of spikes that must be suppressed by the input filter	0	10	ns		

1. Data based on characterization, not tested in production.

2.5 Absolute maximum ratings

Stresses above those listed as “absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 9. Absolute maximum ratings

Symbol	Ratings	Maximum value	Unit
V _{dd}	Supply voltage	-0.3 to 4.8	V
V _{dd_IO}	I/O pins supply voltage	-0.3 to 4.8	V
V _{in}	Input voltage on any control pin (CS, SCL/SPC, SDA/SDI/SDO, SDO/SA0)	-0.3 to V _{dd_IO} +0.3	V
A _{POW}	Acceleration (any axis, powered, V _{dd} = 1.8 V)	3000 g for 0.5 ms	g
		10000 g for 0.2 ms	g
A _{UNP}	Acceleration (any axis, unpowered)	3000 g for 0.5 ms	g
		10000 g for 0.2 ms	g
T _{OP}	Operating temperature range	-40 to +85	°C
T _{STG}	Storage temperature range	-40 to +125	°C
ESD	Electrostatic discharge protection	2 (HBM)	kV

Note: Supply voltage on any pin should never exceed 4.8 V.

This device is sensitive to mechanical shock, improper handling can cause permanent damage to the part.

This device is sensitive to electrostatic discharge (ESD), improper handling can cause permanent damage to the part.

3 Terminology and functionality

3.1 Terminology

3.1.1 Sensitivity

Sensitivity describes the gain of the sensor and can be determined by applying 1 g acceleration to it. As the sensor can measure DC accelerations this can be done easily by pointing the axis of interest towards the center of the Earth, noting the output value, rotating the sensor by 180 degrees (pointing to the sky) and noting the output value again. By doing so, ± 1 g acceleration is applied to the sensor. Subtracting the larger output value from the smaller one, and dividing the result by 2, leads to the actual sensitivity of the sensor. This value changes very little over temperature and time. The sensitivity tolerance describes the range of sensitivities of a large population of sensors.

3.1.2 Zero-g level offset

Zero-g level offset describes the deviation of an actual output signal from the ideal output signal if no acceleration is present. A sensor in a steady state on a horizontal surface will measure 0 g on the X-axis and 0 g on the Y-axis whereas the Z-axis will measure 1 g. The output is ideally in the middle of the dynamic range of the sensor (content of OUT registers 00h, data expressed as two's complement number). A deviation from ideal value in this case is called Zero-g level offset. Offset is to some extent a result of stress to the MEMS sensor and therefore the offset can slightly change after mounting the sensor onto a printed circuit board or exposing it to extensive mechanical stress. Offset changes little over temperature, see "Zero-g level offset change vs. temperature".

3.2 Functionality

3.2.1 Operating modes

Two sets of operating modes have been designed to offer the customer a broad choice of noise/power consumption combinations:

- Low-noise disabled (see [Table 10. Operating modes - low-noise setting disabled](#))
- Low-noise enabled (see [Table 11. Operating modes - low-noise setting enabled](#))

Writing the LOW_NOISE bit in [CTRL6 \(25h\)](#) selects the operating mode (low-noise).

From each of these two sets, five operating modes have been designed:

- 1 High-Performance Mode: focus on low noise
- 4 Low-Power Modes: trade-off between noise and power consumption

These operating modes are selected by writing the MODE[1:0] and LP_MODE[1:0] bits in [CTRL1 \(20h\)](#).

Table 10. Operating modes - low-noise setting disabled

Parameter		High-Performance Mode	Low-Power Mode 4	Low-Power Mode 3	Low-Power Mode 2	Low-Power Mode 1
Resolution [bit]		14-bit	14-bit	14-bit	14-bit	12-bit
ODR [Hz]		12.5 - 1600	1.6 - 200	1.6 - 200	1.6 - 200	1.6 - 200
BW [Hz]		ODR/2 (N/A for 1600 Hz), ODR/4, ODR/10, ODR/20	180 ODR/4, ODR/10, ODR/20	360 ODR/4, ODR/10, ODR/20	720 ODR/4, ODR/10, ODR/20	3200 ODR/4, ODR/10, ODR/20
Noise density [$\mu\text{g}/\sqrt{\text{Hz}}$] @ FS = $\pm 2\text{ g}$, ODR=200 Hz		110	160	210	300	550
Current consumption [μA] @ Vdd=1.8 V	ODR=1.6 Hz	-	0.65	0.55	0.45	0.38
	ODR=12.5 Hz	90	4	2.5	1.6	1
	ODR=25 Hz	90	8.5	4.5	3	1.5
	ODR=50 Hz	90	16	9	5.5	3
	ODR=100 Hz	90	32	17.5	10.5	5
	ODR=200 Hz	90	63	34.5	20.5	10
	ODR=400, 800, 1600 Hz	90	-	-	-	-

Table 11. Operating modes - low-noise setting enabled

Parameter		High-Performance Mode	Low-Power Mode 4	Low-Power Mode 3	Low-Power Mode 2	Low-Power Mode 1
Resolution [bit]		14-bit	14-bit	14-bit	14-bit	12-bit
ODR [Hz]		12.5 - 1600	1.6 - 200	1.6 - 200	1.6 - 200	1.6 - 200
BW [Hz]		ODR/2 (N/A for 1600 Hz), ODR/4, ODR/10, ODR/20	180 ODR/4, ODR/10, ODR/20	360 ODR/4, ODR/10, ODR/20	720 ODR/4, ODR/10, ODR/20	3200 ODR/4, ODR/10, ODR/20
Noise density [$\mu\text{g}/\sqrt{\text{Hz}}$] @ FS = ± 2 g, ODR=200 Hz		90	130	180	240	450
Current consumption [μA] @ Vdd=1.8 V	ODR=1.6 Hz	-	0.7	0.6	0.5	0.4
	ODR=12.5 Hz	120	5	3	2	1.1
	ODR=25 Hz	120	10	6	3.5	2
	ODR=50 Hz	120	20	11	7	3.5
	ODR=100 Hz	120	39	21.5	13	6
	ODR=200 Hz	120	77	42	25	12
	ODR=400, 800, 1600 Hz	120	-	-	-	-

3.2.2 Single data conversion on-demand mode

The device features a single data conversion on-demand mode which is valid for both sets of operating modes (low-noise disabled or enabled) in the 4 low-power modes. This mode is enabled by writing the MODE[1:0] bits to '10' in CTRL1 (20h). Low power modes are selected by writing the LP_MODE[1:0] bits in CTRL1 (20h).

The trigger for output data generation can be managed through the I²C/SPI or by applying a clock signal on the INT2 pin acting here as an input by writing the SLP_MODE_SEL bit in CTRL3 (22h):

- When SLP_MODE_SEL = '0', output data generation is triggered by the clock signal on the INT2 pin (see Figure 5. Single data conversion on-demand functionality).
- When SLP_MODE_SEL = '1', output data generation starts when the SLP_MODE_1 bit is set to '1' logic through the I²C/SPI. When XL data are available in the registers, this bit is automatically set to '0' and the device is ready for another triggered session.

Output data are generated according to the selected low-power mode.

When output data is saved in an output register or FIFO, the device goes to power-down mode and waits for a new trigger.

All ODRs in the range from 0 to up to 200 Hz are supported due to the INT2 clock input.

A DRDY signal or FIFO flags are available on the INT1 pin.

Power consumption is the same as that of standard low-power modes for the same ODR.

Figure 5. Single data conversion on-demand functionality

At the end of turn-on time T_{on} , the DRDY interrupt is activated, output data are available to be read and the device goes into power-down. T_{on} values depend on the low-power mode as follows:

T_{on} (typ.) =

- 1.20 ms for Low-Power Mode 1
- 1.70 ms for Low-Power Mode 2
- 2.30 ms for Low-Power Mode 3
- 3.55 ms for Low-Power Mode 4

3.2.3 Self-test

The self-test allows checking the sensor functionality without moving it. The self-test function is off when the self-test bits (ST) are programmed to '00'. When the self-test bits are changed, an actuation force is applied to the sensor, simulating a definite input acceleration. In this case the sensor outputs will exhibit a change in their DC levels which are related to the selected full scale through the device sensitivity. When the self-test is activated, the device output level is given by the algebraic sum of the signals produced by the acceleration acting on the sensor and by the electrostatic test-force. If the output signals change within the amplitude specified in Table 3. Mechanical characteristics, then the sensor is working properly and the parameters of the interface chip are within the defined specifications.

3.2.4 Activity/Inactivity, Android stationary/motion-detection functions

The activity/inactivity function recognizes the device's sleep state and allows reducing system power consumption.

When the activity/inactivity function is activated by setting the INTERRUPTS_ENABLE bit in CTRL7 (3Fh) and the SLEEP_ON bit in WAKE_UP_THS (34h), the LIS2DTW12 automatically goes to 12.5 Hz ODR in the low-power mode previously selected by the LP_MODE[1:0] bits in CTRL1 (20h) if the sleep state condition is detected and wakes up as soon as the interrupt event has been detected, increasing the output data rate and bandwidth.

With this feature the system may be efficiently switched from low-power mode to full performance depending on user-selectable positioning and acceleration events, thus ensuring power saving and flexibility.

The Android stationary/motion detection function only recognizes the device's sleep state.

When the Android stationary/motion-detection function is activated by setting the STATIONARY bit in WAKE_UP_DUR (35h), the LIS2DTW12 detects acceleration below a fixed threshold but does not change either ODR or operating mode (High-Performance mode or Low-Power mode) after sleep state detection.

The Activity/Inactivity recognition function can use the high-pass filter or the offset outputs, this choice can be made through the USR_OFF_ON_OUT bit in CTRL7 (3Fh).

If the device is in sleep (inactivity/stationary) mode, when at least one of the axes exceeds the threshold in WAKE_UP_THS (34h), the device goes into a sleep-to-wake state (as wake-up).

For the activity/inactivity function, the device, in a wake-up state, will return to the operating mode (HP or LP) and ODR before sleep state detection.

Activity/Inactivity, Android stationary/motion-detection threshold and duration can be configured in the following control registers:

WAKE_UP_THS (34h)

WAKE_UP_DUR (35h)

3.2.5 High tap/double-tap user configurability

The device embeds the possibility to select the following parameters:

- single axis or multiple axes in TAP_THS_Z (32h)
- axis priority in TAP_THS_Y (31h)
- threshold value of each axis in TAP_THS_X (30h), TAP_THS_Y (31h), and TAP_THS_Z (32h)
- max time threshold between 2 consecutive taps for double-tap recognition, min time threshold between 2 consecutive taps to detect a new tap event in INT_DUR (33h)

3.2.6 Offset management

The user can manage offset in the output or for wakeup detection using dedicated embedded hardware (see Section 5.1 Block diagram of filters).

3.3 Sensing element

A proprietary process is used to create a surface micromachined accelerometer. The technology allows processing suspended silicon structures which are attached to the substrate in a few points called anchors and are free to move in the direction of the sensed acceleration. In order to be compatible with the traditional packaging techniques, a cap is placed on top of the sensing element to avoid blocking the moving parts during the molding phase of the plastic encapsulation. When an acceleration is applied to the sensor the proof mass displaces from its nominal position, causing an imbalance in the capacitive half-bridge. This imbalance is measured using charge integration in response to a voltage pulse applied to the capacitor.

At steady-state the nominal value of the capacitors are a few pF and when an acceleration is applied, the maximum variation of the capacitive load is in the fF range.

3.4 IC interface

The complete measurement chain is composed of a low-noise capacitive amplifier which converts the capacitive unbalancing of the MEMS sensor into an analog voltage using an analog-to-digital converter.

The acceleration data may be accessed through an I²C/SPI interface thus making the device particularly suitable for direct interfacing with a microcontroller.

The LIS2DTW12 features a data-ready signal which indicates when a new set of measured acceleration data is available, thus simplifying data synchronization in the digital system that uses the device.

3.5 Factory calibration

The IC interface is factory-calibrated for sensitivity (S_0) and Zero-g level offset.

The trim values are stored inside the device in nonvolatile memory. Any time the device is turned on, the trimming parameters are downloaded into the registers to be used during active operation. This allows using the device without further calibration. If an accidental write occurs in the registers where trimming parameters are stored, the BOOT bit in [CTRL2 \(21h\)](#) can help to retrieve the correct trimming parameters from nonvolatile memory without the need to switch on/off the device. This bit is automatically reset at the end of the download operation. Setting this bit has no impact on the control registers.

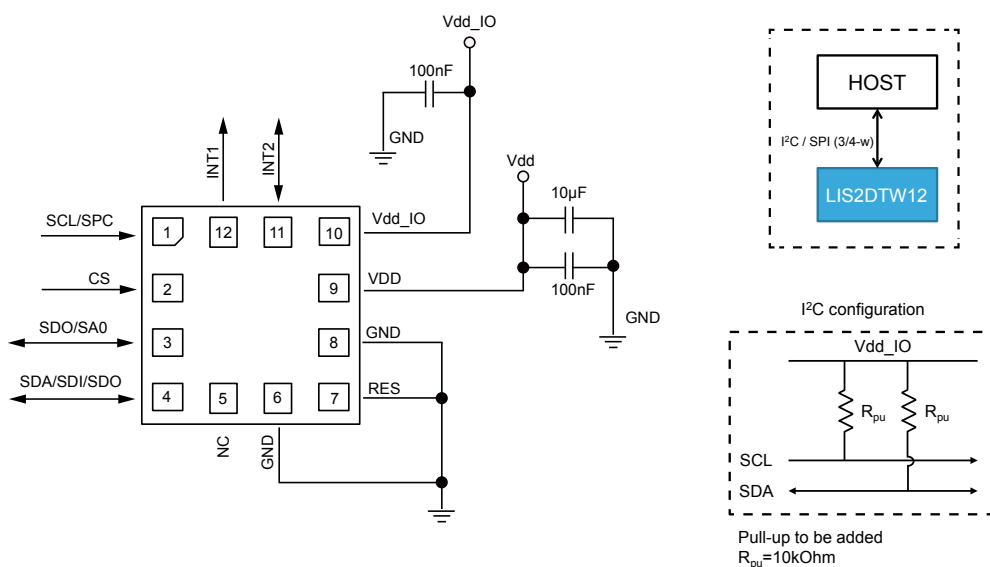

3.6 Temperature sensor

The temperature is available in [OUT_T_L \(0Dh\)](#), [OUT_T_H \(0Eh\)](#) stored as two's complement data, left-justified in 12-bit mode.

Refer to [Table 5. Temperature sensor characteristics](#) for the conversion factor.

4 Application hints

Figure 6. LIS2DTW12 electrical connections (top view)

The device core is supplied through the Vdd line while the I/O pads are supplied through the Vdd_IO line. Power supply decoupling capacitors (100 nF ceramic, 10 µF aluminum) should be placed as near as possible to pin 9 of the device (common design practice).

All the voltage and ground supplies must be present at the same time to have proper behavior of the IC (refer to [Figure 6. LIS2DTW12 electrical connections \(top view\)](#)). It is possible to remove Vdd while maintaining Vdd_IO without blocking the communication bus, in this condition the measurement chain is powered off.

The functionality of the device and the measured acceleration data are selectable and accessible through the I²C or SPI interfaces. When using the I²C, CS must be tied high (i.e. connected to Vdd_IO).

The functions, the threshold and the timing of the two interrupt pins (INT1 and INT2) can be completely programmed by the user through the I²C/SPI interface.

Table 12. Internal pin status

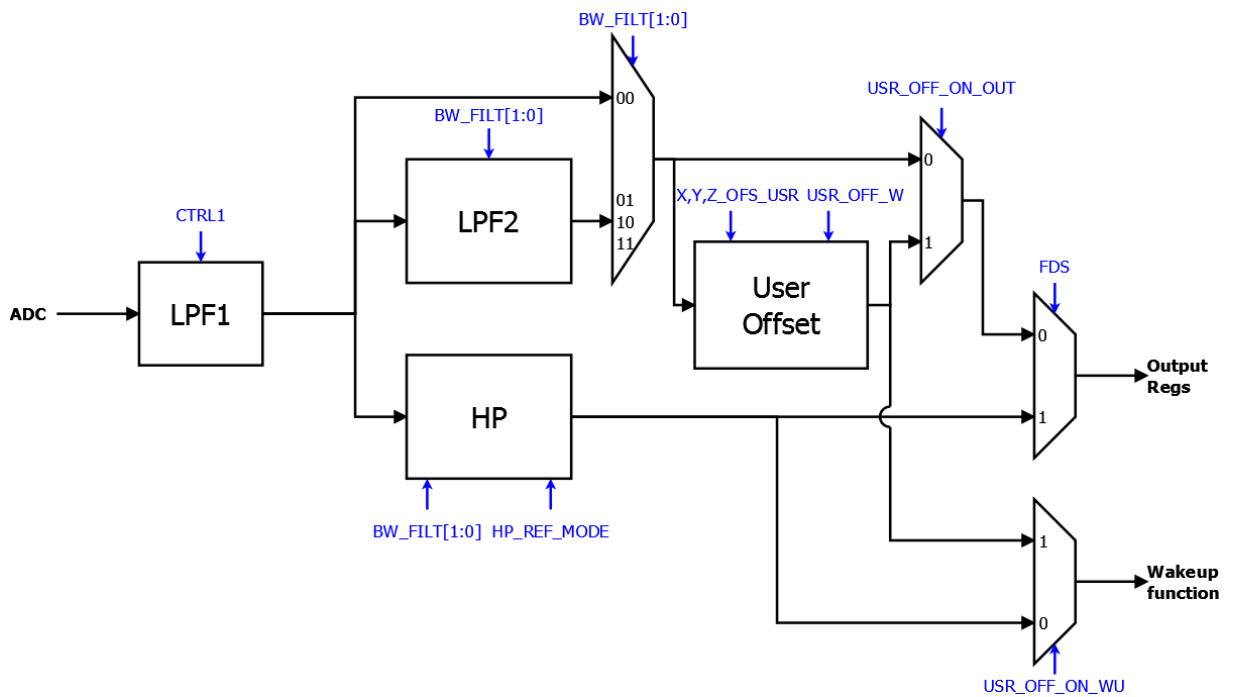

Pin #	Name	Function	Pin status
1	SCL SPC	I ² C serial clock (SCL) SPI serial port clock (SPC)	Default: open drain
2	CS	SPI enable I ² C/SPI mode selection 1: SPI idle mode / I ² C communication enabled 0: SPI communication mode / I ² C disabled	Default: input with internal pull-up ⁽¹⁾
3	SDO SA0	Serial data output (SDO) I ² C less significant bit of the device address (SA0)	Default: input with internal pull-up
4	SDA SDI SDO	I ² C serial data (SDA) SPI serial data input (SDI) 3-wire interface serial data output (SDO)	Default: (SDA) input open drain
5	NC	Internally not connected. Can be tied to VDD, VDDIO, or GND.	
6	GND	0 V supply	
7	RES	Connect to GND	
8	GND	0 V supply	
9	VDD	Power supply	
10	VDD_IO	Power supply for I/O pins	
11	INT2	Interrupt pin 2. Clock input when selected in single data conversion on demand.	Default: push-pull output forced to Gnd
12	INT1	Interrupt pin 1	Default: push-pull output forced to Gnd

1. In order to disable the internal pull-up on the CS pin, write '1' to the CS_PU_DISC bit in CTRL2 (21h).

5 Digital main blocks

5.1 Block diagram of filters

Figure 7. Accelerometer chain

Referring to [Figure 7. Accelerometer chain](#), the first block is the Low-Pass Filter 1 (LPF1) whose behavior is a function of the actual ODR and mode selected in [CTRL1 \(20h\)](#). The signal is then downsampled and can be either directly sent to the output registers or to the Low-Pass Filter 2 (LPF2) or High-Pass-Filter (HP) using the [BW_FILT\[1:0\]](#) bits and [FDS](#) bit in [CTRL6 \(25h\)](#).

In the low-pass path, it is possible to apply a user offset determined by the [X_OFS_USR \(3Ch\)](#), [Y_OFS_USR \(3Dh\)](#), [Z_OFS_USR \(3Eh\)](#) register values and the [USR_OFF_W](#) bit in [CTRL7 \(3Fh\)](#) and send the result to the output using the [USR_OFF_ON_OUT](#) bit in [CTRL7 \(3Fh\)](#).

In the high-pass path, it is possible to use the high-pass filter reference mode (HP) using the [HP_REF_MODE](#) bit in [CTRL7 \(3Fh\)](#).

5.2 Data stabilization time vs. ODR/device setting

Some data samples need to be discarded when changing the ODR in HP mode with ODR/2 bandwidth selection. The table below provides the number of samples to be discarded in order to obtain valid usable data.

Table 13. Number of samples to be discarded

MODE[1:0] in CTRL1 (20h)	ODR [Hz]	BW_FILT[1:0] in CTRL6 (25h)	Samples to be discarded
00	-		0
01	12.5	00	0
	25		0
	50		0
	100		1
	200		1
	400		1
	800		1
	1600		2

5.3 FIFO

The LIS2DTW12 embeds 32 slots of 14-bit data FIFO for each of the three output channels, X, Y and Z of the acceleration data. This allows consistent power saving for the system, since the host processor does not need to continuously poll data from the sensor, but it can wake up only when needed and burst the significant data out from the FIFO.

The internal FIFO allows collecting 32 samples (14-bit size data) for each axis.

When the FIFO mode is other than Bypass, reading the output registers (28h to 2Dh) returns the oldest FIFO sample set. In order to minimize communication between the master and slave, the address read may be automatically incremented by the device by setting the IF_ADD_INC bit of CTRL2 (21h) to '1'; the device rolls back to 0x28 when register 0x2D is reached.

This buffer can work according to the following 5 different modes:

- Bypass mode
- FIFO mode
- Continuous-to-FIFO
- Bypass-to-Continuous
- Continuous

Each mode is selected by the FMode[2:0] bits in the FIFO_CTRL (2Eh) register.

Programmable FIFO threshold is selected in FIFO_CTRL (2Eh). Status and FIFO overrun events are available in the FIFO_SAMPLES (2Fh) register and can be used to generate dedicated interrupts on the INT1 and INT2 pins using the CTRL4_INT1_PAD_CTRL (23h) and CTRL5_INT2_PAD_CTRL (24h) registers.

FIFO_SAMPLES (2Fh) (FIFO_FTH) goes to '1' when the number of unread samples FIFO_SAMPLES (2Fh) (Diff[5:0]) is greater than or equal to FTH[4:0] in FIFO_CTRL (2Eh).

If FTH[4:0] is equal to '0', FIFO_SAMPLES (2Fh) (FIFO_FTH) goes to '0'.

FIFO_SAMPLES (2Fh) (FIFO_OVR) is equal to '1' if a FIFO slot is overwritten.

FIFO_SAMPLES (2Fh) (Diff[5:0]) contains stored data levels of unread samples. When Diff[5:0] is equal to '000000', FIFO is empty. When Diff[5:0] is equal to '100000', FIFO is full and the unread samples are 32.

To guarantee the correct acquisition of data during the switching into and out of FIFO, the first sample acquired must be discarded.

When the FIFO threshold status flag is '0'-logic, FIFO filling is lower than the threshold level and when '1'-logic, FIFO filling is equal to or higher than the threshold level.

5.3.1 Bypass mode

In Bypass mode ([FIFO_CTRL \(2Eh\)](#) (FMode [2:0])= 000), the FIFO is not operational, no data is collected in FIFO memory, and it remains empty with the only actual sample available in the output registers.

Bypass mode is also used to reset the FIFO when in FIFO mode.

For each channel only the first address is used. When new data is available, the old data is overwritten.

5.3.2 FIFO mode

In FIFO mode ([FIFO_CTRL \(2Eh\)](#)(FMode [2:0])= 001) data from the X, Y and Z channels are stored in the FIFO until it is full, when 32 unread samples are stored in memory, data collecting is stopped.

To reset the FIFO content, Bypass mode should be written in the [FIFO_CTRL \(2Eh\)](#) register, setting the FMODE [2:0] bits to '000'. After this reset command, it is possible to restart FIFO mode, writing the value '001' in [FIFO_CTRL \(2Eh\)](#)(FMODE [2:0]).

The FIFO buffer can memorize 32 slots of X, Y and Z data.

5.3.3 Continuous mode

Continuous mode ([FIFO_CTRL \(2Eh\)](#) (FMode[2:0] = 110) provides a continuous FIFO update: when 32 unread samples are stored in memory, as new data arrives the oldest data is discarded and overwritten by the newer.

A FIFO threshold flag [FIFO_SAMPLES \(2Fh\)](#) (FIFO_FTH) is asserted when the number of unread samples in FIFO is greater than or equal to ([FIFO_CTRL \(2Eh\)](#)FTH[4:0]).

It is possible to route [FIFO_SAMPLES \(2Fh\)](#)(FTH) to the INT1 pin by writing the INT1_FTH bit to '1' in register [CTRL4_INT1_PAD_CTRL \(23h\)](#) or to the INT2 pin by writing the INT2_FTH bit to '1' in register [CTRL5_INT2_PAD_CTRL \(24h\)](#).

If an overrun occurs, the oldest sample in FIFO is overwritten and the FIFO_OVR flag in [FIFO_SAMPLES \(2Fh\)](#) is asserted.

In order to empty the FIFO before it is full, it is also possible to pull from FIFO the number of unread samples available in [FIFO_SAMPLES \(2Fh\)](#) (Diff[5:0]).

5.3.4 Continuous-to-FIFO mode

In Continuous-to-FIFO mode `FIFO_CTRL (2Eh)(FMode[2:0] = 011)`, FIFO operates in Continuous mode and FIFO mode starts upon an internal trigger event. When the FIFO is full, data collecting is stopped. The trigger could be a single or double tap, wake-up, free-fall, 6D interrupt or any combination of these events, but every interrupt has to be routed on the corresponding pad to be used as a trigger.

Figure 8. Continuous-to-FIFO mode

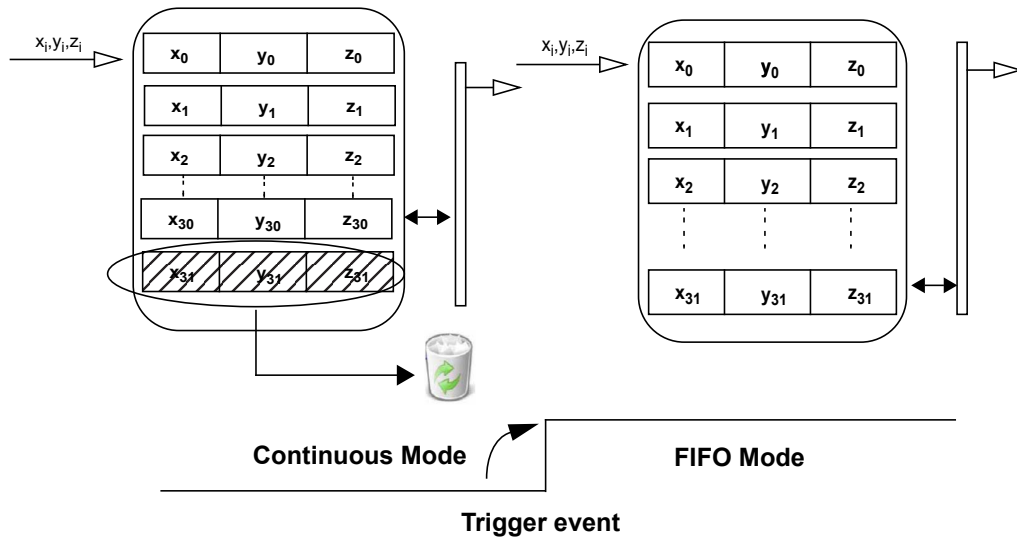

Figure 9. Trigger event to FIFO for Continuous-to-FIFO mode

5.3.5 Bypass-to-Continuous mode

In Bypass-to-Continuous mode (FIFO_CTRL (2Eh)(FMode[2:0] = '100'), data measurement storage inside FIFO starts in Continuous mode upon an internal trigger event, then the sample that follows the trigger is available in FIFO. The trigger could be a single or double tap, wake-up, free-fall, 6D interrupt or any combination of these events, but every interrupt has to be routed on the corresponding pad to be used as a trigger.

Figure 10. Bypass-to-Continuous mode

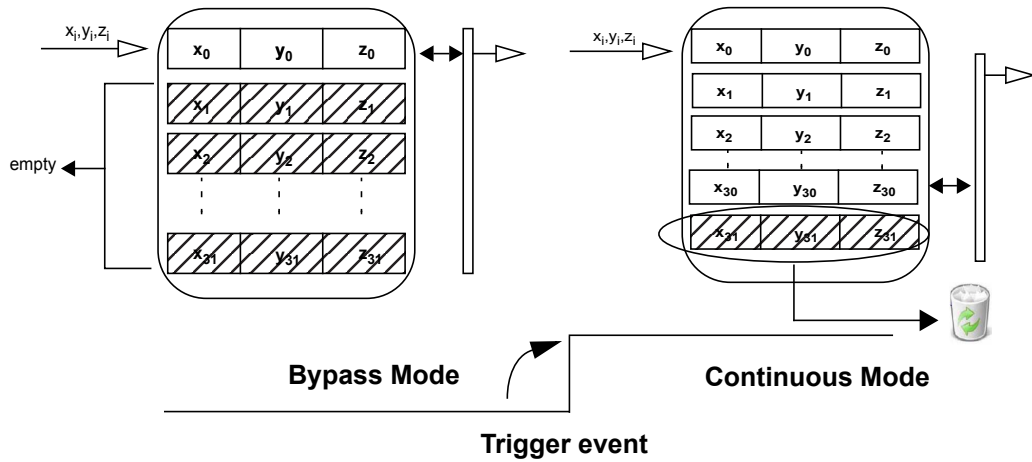

Figure 11. Trigger event to FIFO for Bypass-to-Continuous mode

6 Digital interfaces

The registers embedded inside the LIS2DTW12 may be accessed through both the I²C and SPI serial interfaces. The latter may be SW configured to operate either in 3-wire or 4-wire interface mode.

The serial interfaces are mapped to the same pins. To select/exploit the I²C interface, the CS line must be tied high (i.e. connected to Vdd_IO).

Table 14. Serial interface pin description

Pin name	Pin description
CS	SPI enable I ² C/SPI mode selection (1: SPI idle mode / I ² C communication enabled; 0: SPI communication mode / I ² C disabled)
SCL	I ² C serial clock (SCL)
SPC	SPI serial port clock (SPC)
SDA	I ² C serial data (SDA)
SDI	SPI serial data input (SDI)
SDO	3-wire interface serial data output (SDO)
SA0	I ² C address selection (SA0)
SDO	SPI serial data output (SDO)

6.1 I²C serial interface

The LIS2DTW12 I²C is a bus slave. The I²C is employed to write data into registers whose content can also be read back.

The relevant I²C terminology is given in the table below.

Table 15. I²C terminology

Term	Description
Transmitter	The device which sends data to the bus
Receiver	The device which receives data from the bus
Master	The device which initiates a transfer, generates clock signals and terminates a transfer
Slave	The device addressed by the master

There are two signals associated with the I²C bus: the serial clock line (SCL) and the Serial DATA line (SDA). The latter is a bidirectional line used for sending and receiving the data to/from the interface. Both the lines must be connected to Vdd_IO through an external pull-up resistor. When the bus is free, both the lines are high.

The I²C interface is compliant with fast mode (400 kHz) I²C standards as well as with normal mode.

In order to disable the I²C block, CTRL2 (21h) (I2C_DISABLE) = 1 must be set.

6.1.1 I²C operation

The transaction on the bus is started through a START (ST) signal. A START condition is defined as a high-to-low transition on the data line while the SCL line is held high. After this has been transmitted by the master, the bus is considered busy. The next byte of data transmitted after the start condition contains the address of the slave in the first 7 bits and the eighth bit tells whether the master is receiving data from the slave or transmitting data to the slave. When an address is sent, each device in the system compares the first seven bits after a start condition with its address. If they match, the device considers itself addressed by the master.

The Slave Address (SAD) associated to the LIS2DTW12 is 001100xb where the x bit is modified by the SA0/SDO pin in order to modify the device address. If the SA0/SDO pin is connected to the supply voltage, the address is 0011001b, otherwise if the SA0/SDO pin is connected to ground, the address is 0011000b. This solution permits to connect and address two different accelerometers to the same I²C lines.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line low so that it remains stable low during the high period of the acknowledge clock pulse. A receiver which has been addressed is obliged to generate an acknowledge after each byte of data received.

The I²C embedded inside the LIS2DTW12 behaves like a slave device and the following protocol must be adhered to. After the start condition (ST) a slave address is sent. Once a slave acknowledge (SAK) has been returned, an 8-bit sub-address (SUB) is transmitted: the 7 LSb represents the actual register address while the CTRL2 (21h) (IF_ADD_INC) bit defines the address increment.

The slave address is completed with a Read/Write bit. If the bit is '1' (Read), a repeated START (SR) condition must be issued after the two sub-address bytes. If the bit is '0' (Write) the master will transmit to the slave with direction unchanged. Table 16 explains how the SAD+Read/Write bit pattern is composed, listing all the possible configurations.

Table 16. SAD+Read/Write patterns

Command	SAD[6:1]	SAD[0] = SA0	R/W	SAD+R/W
Read	001100	0	1	00110001 (31h)
Write	001100	0	0	00110000 (30h)
Read	001100	1	1	00110011 (33h)
Write	001100	1	0	00110010 (32h)

Table 17. Transfer when master is writing one byte to slave

Master	ST	SAD + W		SUB		DATA		SP
Slave			SAK		SAK		SAK	

Table 18. Transfer when master is writing multiple bytes to slave

Master	ST	SAD + W		SUB		DATA		DATA		SP
Slave			SAK		SAK		SAK		SAK	

Table 19. Transfer when master is receiving (reading) one byte of data from slave

Master	ST	SAD + W		SUB		SR	SAD + R			NMAK	SP
Slave			SAK		SAK			SAK	DATA		

Table 20. Transfer when master is receiving (reading) multiple bytes of data from slave

Master	ST	SAD +W		SUB		SR	SAD+R			MAK		MAK		NMAK	SP
Slave			SAK		SAK			SAK	DATA		DATA		DATA		

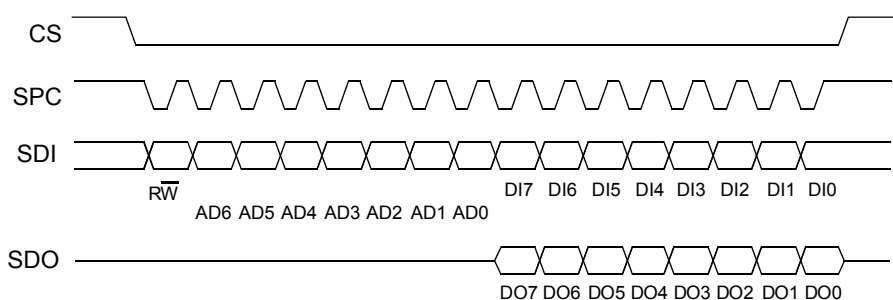

Data are transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes transferred per transfer is unlimited. Data is transferred with the Most Significant bit (MSb) first. If a receiver can't receive another complete byte of data until it has performed some other function, it can hold the clock line, SCL low to force the transmitter into a wait state. Data transfer only continues when the receiver is ready for another byte and releases the data line. If a slave receiver doesn't acknowledge the slave address (i.e. it is not able to receive because it is performing some real-time function) the data line must be left high by the slave. The master can then abort the transfer. A low-to-high transition on the SDA line while the SCL line is high is defined as a STOP condition. Each data transfer must be terminated by the generation of a STOP (SP) condition.

In the presented communication format MAK is Master acknowledge and NMAK is No Master Acknowledge.

6.2 SPI bus interface

The LIS2DTW12 SPI is a bus slave. The SPI allows writing to and reading from the registers of the device. The serial interface interacts with the application using 4 wires: **CS**, **SPC**, **SDI** and **SDO**.

Figure 12. Read and write protocol

CS is the serial port enable and it is controlled by the SPI master. It goes low at the start of the transmission and goes back high at the end. **SPC** is the serial port clock and it is controlled by the SPI master. It is stopped high when **CS** is high (no transmission). **SDI** and **SDO** are respectively the serial port data input and output. Those lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the read register and write register commands are completed in 16 clock pulses or in multiples of 8 in case of multiple read/write bytes. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS** while the last bit (bit 15, bit 23, ...) starts at the last falling edge of **SPC** just before the rising edge of **CS**.

bit 0: \overline{RW} bit. When 0, the data DI(7:0) is written into the device. When 1, the data DO(7:0) from the device is read. In latter case, the chip will drive **SDO** at the start of bit 8.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written into the device (MSb first).

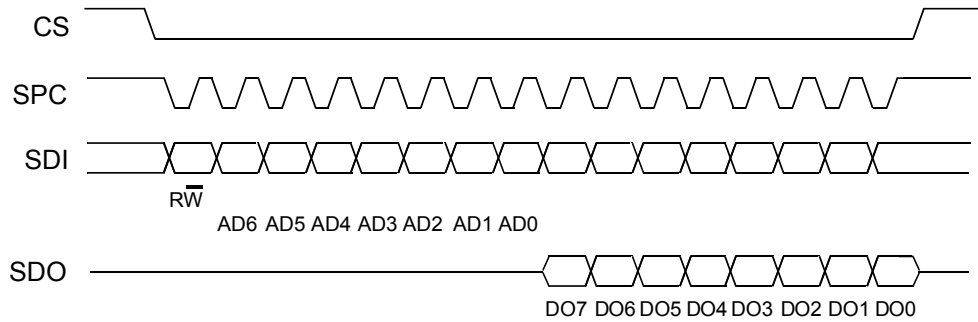

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

In multiple read/write commands additional blocks of 8 clock periods will be added. When the **CTRL2 (21h)** (IF_ADD_INC) bit is '0', the address used to read/write data remains the same for every block. When the **CTRL2 (21h)** (IF_ADD_INC) bit is '1', the address used to read/write data is increased at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

6.2.1 SPI read

Figure 13. SPI read protocol

The SPI read command is performed with 16 clock pulses. A multiple byte read command is performed by adding blocks of 8 clock pulses to the previous one.

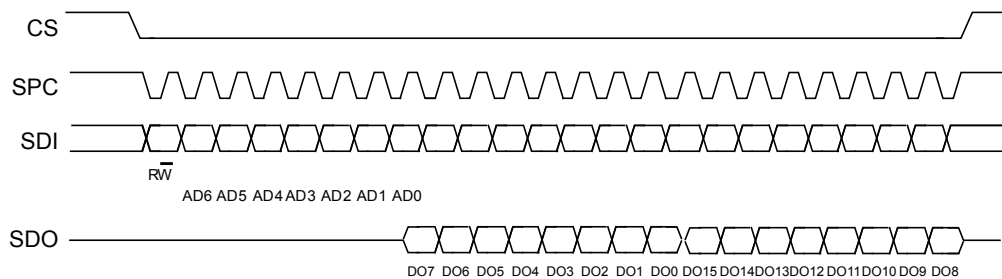

bit 0: READ bit. The value is 1.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that will be read from the device (MSb first).

bit 16-... : data DO(...-8). Additional data in multiple byte reads.

Figure 14. Multiple byte SPI read protocol (2-byte example)

6.2.2 SPI write

Figure 15. SPI write protocol

The SPI write command is performed with 16 clock pulses. A multiple byte write command is performed by adding blocks of 8 clock pulses to the previous one.

bit 0: WRITE bit. The value is 0.

bit 1 -7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written inside the device (MSb first).

bit 16-... : data DI(...-8). Additional data in multiple byte writes.

Figure 16. Multiple byte SPI write protocol (2-byte example)

6.2.3 SPI read in 3-wire mode

3-wire mode is entered by setting the CTRL2 (21h) (SIM) bit equal to '1' (SPI serial interface mode selection).

Figure 17. SPI read protocol in 3-wire mode

The SPI read command is performed with 16 clock pulses:

bit 0: READ bit. The value is 1.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

A multiple read command is also available in 3-wire mode.

7 Register mapping

The table given below provides a list of the 8-bit registers embedded in the device and the corresponding addresses.

Table 21. Register map

Name	Type ⁽¹⁾	Register address		Default	Comment
		Hex	Binary		
OUT_T_L	R	0D	00001101	00000000	Temp sensor output
OUT_T_H	R	0E	00001110	00000000	
WHO_AM_I	R	0F	00001111	01000100	Who am I ID
RESERVED	-	10-1F		-	RESERVED
CTRL1	R/W	20	00100000	00000000	Control registers
CTRL2	R/W	21	00100001	00000100	
CTRL3	R/W	22	00100010	00000000	
CTRL4_INT1_PAD_CTRL	R/W	23	00100011	00000000	
CTRL5_INT2_PAD_CTRL	R/W	24	00100100	00000000	
CTRL6	R/W	25	00100101	00000000	
RESERVED	-	26		-	RESERVED
STATUS	R	27	00100111	00000000	Status data register
OUT_X_L	R	28	00101000	00000000	Output registers
OUT_X_H	R	29	00101001	00000000	
OUT_Y_L	R	2A	00101010	00000000	
OUT_Y_H	R	2B	00101011	00000000

CTRL7	R/W	3F	00000100	00000000	

1. R = read-only register, R/W = readable/writable register

Registers marked as Reserved must not be changed. Writing to those registers may cause permanent damage to the device.

The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

8 Register description

8.1 OUT_T_L (0Dh)

Temperature output register in 12-bit resolution (r).

Table 22. OUT_T_L register

TEMP3	TEMP2	TEMP1	TEMP0	0	0	0	0
-------	-------	-------	-------	---	---	---	---

Table 23. OUT_T_L register description

TEMP[3:0]	The 8 least significant bits of the temperature sensor output. Sensitivity = 16 LSB/°C. Together with OUT_T_H (0Eh) , it forms the output value expressed as a 16-bit word in 2's complement.
-----------	--

8.2 OUT_T_H (0Eh)

Temperature output register in 12-bit resolution (r).

Table 24. OUT_T_H register

TEMP11	TEMP10	TEMP9	TEMP8	TEMP7	TEMP6	TEMP5	TEMP4

8.5 CTRL2 (21h)

Control register 2 (r/w)

Table 32. Control register 2

BOOT	SOFT_RESET	0 ⁽¹⁾	CS_PU_DISC	BDU	IF_ADD_INC	I2C_DISABLE	SIM
------	------------	------------------	------------	-----	------------	-------------	-----

1. This bit must be set to '0' for the correct operation of the device.

BOOT	Boot enables retrieving the correct trimming parameters from nonvolatile memory into registers where trimming parameters are stored. Once the operation is over, this bit automatically returns to 0. Default value: 0 (0: disabled; 1: enabled)
SOFT_RESET	Soft reset acts as reset for all control registers, then goes to 0. Default value: 0 (0: disabled; 1: enabled)
CS_PU_DISC	Disconnect CS pull-up. Default value: 0 (0: pull-up connected to CS pin; 1: pull-up disconnected to CS pin)
BDU	Block data update. Default value: 0 (0: continuous update; 1: output registers not updated until MSB and LSB read)
IF_ADD_INC	Register address automatically incremented during multiple byte access with a serial interface (I ² C or SPI). Default value: 1 (0: disabled; 1: enabled)
I2C_DISABLE	Disable I ² C communication protocol. Default value: 0 (0: SPI and I ² C interfaces enabled; 1: I ² C mode disabled)
SIM	SPI serial interface mode selection. Default value: 0 0: 4-wire interface; 1: 3-wire interface

The BDU bit is used to inhibit the update of the output registers until both upper and lower register parts are read. In default mode (BDU = '0') the output register values are updated continuously. When the BDU is activated (BDU = '1'), the content of the output registers is not updated until both MSB and LSB are read which avoids reading values related to different sample times.

8.6 CTRL3 (22h)

Control register 3 (r/w)

Table 33. Control register 3

ST2	ST1	PP_OD	LIR	H_LACTIVE	0	SLP_MODE_SEL	SLP_MODE_1
-----	-----	-------	-----	-----------	---	--------------	------------

Table 34. Control register 3 description

ST[2:1]	Self-test enable. Default value: 00 (00: Self-test disabled; Other: see Table 35. Self-test mode selection)
PP_OD	Push-pull/open-drain selection on interrupt pad. Default value: 0 (0: push-pull; 1: open-drain)
LIR	Latched Interrupt. Switches between latched ('1'-logic) and pulsed ('0'-logic) mode for function source signals and interrupts routed to pins (wakeup, single/double-tap). Default value: 0 (0: interrupt request not latched; 1: interrupt request latched)
H_LACTIVE	Interrupt active high, low. Default value: 0 (0: active high; 1: active low)
SLP_MODE_SEL	Single data conversion on demand mode selection: 0: enabled with external trigger on INT2; 1: enabled by I ² C/SPI writing SLP_MODE_1 to 1.
SLP_MODE_1	Single data conversion on demand mode enable. When SLP_MODE_SEL = '1' and this bit is set to '1' logic, single data conversion on demand mode starts. When XL data are available in the registers, this bit is set to '0' automatically and the device is ready for another triggered session.

Table 35. Self-test mode selection

ST2	ST1	Self-test mode
0	0	Normal mode
0	1	Positive sign self-test
1	0	Negative sign self-test
1	1	-

8.10 STATUS (27h)

Status register (r).

Table 43. STATUS register

FIFO_THS	WU_IA	SLEEP_STATE	DOUBLE_TAP	SINGLE_TAP	6D_IA	FF_IA	DRDY
----------	-------	-------------	------------	------------	-------	-------	------

Table 44. STATUS register description

FIFO_THS	FIFO threshold status flag. (0: FIFO filling is lower than threshold level; 1: FIFO filling is equal to or higher than the threshold level.)
WU_IA	Wakeup event detection status. (0: Wakeup event not detected; 1: Wakeup event detected)
SLEEP_STATE	Sleep event status. (0: Sleep event not detected; 1: Sleep event detected)
DOUBLE_TAP	Double-tap event status (0: Double-tap event not detected; 1: Double-tap event detected)
SINGLE_TAP	Single-tap event status (0: Single-tap event not detected; 1: Single-tap event detected)
6D_IA	Source of change in position portrait/landscape/face-up/face-down. (0: no event detected; 1: a change in position detected)
FF_IA	Free-fall event detection status. (0: free-fall event not detected; 1: free-fall event detected)
DRDY	Data-ready status. (0: not ready; 1: X-, Y- and Z-axis new data available)

8.11 OUT_X_L (28h)

X-axis LSB output register (r).

Table 45. OUT_X_L register

X_L7	X_L6	X_L5	X_L4	X_L3 ⁽¹⁾	X_L2 ⁽¹⁾	0	0
------	------	------	------	---------------------	---------------------	---	---

1. If Low-Power Mode 1 is enabled, this bit is set to 0.

The 8 least significant bits of linear acceleration sensor X-axis output. Together with the [OUT_X_H \(29h\)](#) register, it forms the output value expressed as a 16-bit word in 2's complement.

8.12 OUT_X_H (29h)

X-axis MSB output register (r).

Table 46. OUT_X_H register

X_H7	X_H6	X_H5	X_H4	X_H3	X_H2	X_H1	X_H0
------	------	------	------	------	------	------	------

The 8 most significant bits of linear acceleration sensor X-axis output. Together with the [OUT_X_L \(28h\)](#) register, it forms the output value expressed as a 16-bit word in 2's complement.

8.13 OUT_Y_L (2Ah)

Y-axis LSB output register (r).

Table 47. OUT_Y_L register

Y_L7	Y_L6	Y_L5	Y_L4	Y_L3 ⁽¹⁾	Y_L2 ⁽¹⁾	0	0
------	------	------	------	---------------------	---------------------	---	---

1. If Low-Power Mode 1 is enabled, this bit is set to 0.

The 8 least significant bits of linear acceleration sensor Y-axis output. Together with the [OUT_Y_H \(2Bh\)](#) register, it forms the output value expressed as a 16-bit word in 2's complement.

8.14 OUT_Y_H (2Bh)

Y-axis MSB output register (r).

Table 48. OUT_Y_H register

Y_H7	Y_H6	Y_H5	Y_H4	Y_H3	Y_H2	Y_H1	Y_H0
------	------	------	------	------	------	------	------

The 8 most significant bits of linear acceleration sensor Y-axis output. Together with the [OUT_Y_L \(2Ah\)](#) register, it forms the output value expressed as a 16-bit word in 2's complement.

8.15 OUT_Z_L (2Ch)

Z-axis LSB output register (r).

Table 49. OUT_Z_L register

Z_L7	Z_L6	Z_L5	Z_L4	Z_L3 ⁽¹⁾	Z_L2 ⁽¹⁾	0	0
------	------	------	------	---------------------	---------------------	---	---

1. If Low-power Mode 1 is enabled, this bit is set to 0.

The 8 least significant bits of linear acceleration sensor Z-axis output. Together with the [OUT_Z_H \(2Dh\)](#) register, it forms the output value expressed as a 16-bit word in 2's complement.

8.16 OUT_Z_H (2Dh)

Z-axis MSB output register (r).

Table 50. OUT_Z_H register

Z_H7	Z_H6	Z_H5	Z_H4	Z_H3	Z_H2	Z_H1	Z_H0
------	------	------	------	------	------	------	------

The 8 most significant bits of linear acceleration sensor Z-axis output. Together with the [OUT_Z_L \(2Ch\)](#) register, it forms the output value expressed as a 16-bit word in 2's complement.

8.17 FIFO_CTRL (2Eh)

FIFO control register (r/w).

Table 51. FIFO_CTRL register

FMode2	FMode1	FMode0	FTH4	FTH3	FTH2	FTH1	FTH0
--------	--------	--------	------	------	------	------	------

Table 52. FIFO_CTRL register description

FMode[2:0]	FIFO mode selection bits. Default: 000. For further details refer to Table 53. FIFO mode selection
FTH[4:0]	FIFO threshold level setting.

Table 53. FIFO mode selection

FMode[2:0]	Mode description
000	Bypass mode: FIFO turned off
001	FIFO mode: Stops collecting data when FIFO is full.
010	Reserved
011	Continuous-to-FIFO: Stream mode until trigger is deasserted, then FIFO mode
100	Bypass-to-Continuous: Bypass mode until trigger is deasserted, then FIFO mode
101	Reserved
110	Continuous mode: If the FIFO is full, the new sample overwrites the older sample.
111	Reserved

8.18 FIFO_SAMPLES (2Fh)

FIFO_SAMPLES control register (r).

Table 54. FIFO_SAMPLES register

FIFO_FTH	FIFO_OVR	Diff5	Diff4	Diff3	Diff2	Diff1	Diff0
----------	----------	-------	-------	-------	-------	-------	-------

Table 55. FIFO_SAMPLES register description

FIFO_FTH	FIFO threshold status flag. (0: FIFO filling is lower than threshold level; 1: FIFO filling is equal to or higher than the threshold level.)
FIFO_OVR	FIFO overrun status. (0: FIFO is not completely filled; 1: FIFO is completely filled and at least one sample has been overwritten)
Diff[5:0]	Represents the number of unread samples stored in FIFO. (000000 = FIFO empty; 100000 = FIFO full, 32 unread samples).

8.19 TAP_THS_X (30h)

4D configuration enable and TAP threshold configuration (r/w).

Table 56. TAP_THS_X register

4D_EN	6D_THS1	6D_THS0	TAP_THSX_4	TAP_THSX_3	TAP_THSX_2	TAP_THSX_1	TAP_THSX_0
-------	---------	---------	------------	------------	------------	------------	------------

Table 57. TAP_THS_X register description

4D_EN	4D detection portrait/landscape position enable. (0: no position detected; 1: portrait/landscape detection and face-up/face-down position enabled).
6D_THS[1:0]	Thresholds for 4D/6D function @ FS = ± 2 g (refer to Table 58. 4D/6D threshold setting FS @ ± 2 g)
TAP_THSX_[4:0]	Threshold for TAP recognition @ FS = ± 2 g on X direction

Table 58. 4D/6D threshold setting FS @ ± 2 g

6D_THS[1:0]	Threshold decoding (degrees)
00	6 (80 degrees)
01	11 (70 degrees)

Table 63. TAP_THS_Z register description

TAP_X_EN	Enables X direction in tap recognition. (0: disabled; 1: enabled)
TAP_Y_EN	Enables Y direction in tap recognition. (0: disabled; 1: enabled)
TAP_Z_EN	Enables Z direction in tap recognition. (0: disabled; 1: enabled)
TAP_THSZ_[4:0]	Threshold for tap recognition @ FS = $\pm 2 g$ on Z direction.

8.22 INT_DUR (33h)

Interrupt duration register (r/w).

Table 64. INT_DUR register

LATENCY3	LATENCY2	LATENCY1	LATENCY0	QUIET1	QUIET0	SHOCK1	SHOCK0
----------	----------	----------	----------	--------	--------	--------	--------

Table 65. INT_DUR register description

LATENCY[3:0]	Duration of maximum time gap for double-tap recognition. When double-tap recognition is enabled, this register expresses the maximum time between two successive detected taps to determine a double-tap event. Default value is LATENCY[3:0] = 0000 (which is $16 * 1/ODR$) 1 LSB = $32 * 1/ODR$
QUIET[1:0]	Expected quiet time after a tap detection: this register represents the time after the first detected tap in which there must not be any overthreshold event. Default value is QUIET[1:0] = 00 (which is $2 * 1/ODR$) 1 LSB = $4 * 1/ODR$
SHOCK[1:0]	Maximum duration of over-threshold event: this register represents the maximum time of an over-threshold signal detection to be recognized as a tap event. Default value is SHOCK[1:0] = 00 (which is $4 * 1/ODR$) 1 LSB = $8 * 1/ODR$

8.23 WAKE_UP_THS (34h)

Wakeup threshold register (r/w).

Table 66. WAKE_UP_THS register

SINGLE_ DOUBLE_ TAP	SLEEP_ON	WK_THS5	WK_THS4	WK_THS3	WK_THS 2	WK_THS 1	WK_THS 0
---------------------	----------	---------	---------	---------	----------	----------	----------

Table 67. WAKE_UP_THS register description

SINGLE_DOUBLE_TAP	Enable single/double-tap event. Default value: 0 (0: only single-tap event is enabled; 1: single and double-tap events are enabled)
SLEEP_ON	Sleep (inactivity) enable. Default value: 0 (0: sleep disabled; 1: sleep enabled)
WK_THS[5:0]	Wakeup threshold, 6-bit unsigned 1 LSB = $1/64$ of FS. Default value: 000000

8.24 WAKE_UP_DUR (35h)

Wakeup and sleep duration configuration register (r/w).

Table 68. WAKE_UP_DUR register

FF_DUR5	WAKE_DUR1	WAKE_DUR0	STATIONARY	SLEEP_DUR3	SLEEP_DUR2	SLEEP_DUR1	SLEEP_DUR0
---------	-----------	-----------	------------	------------	------------	------------	------------

Table 69. WAKE_UP_DUR register description

FF_DUR5	Free-fall duration. In conjunction with FF_DUR [4:0] bit in FREE_FALL (36h) register. 1 LSB = 1 * 1/ODR
WAKE_DUR[1:0]	Wakeup duration. 1 LSB = 1 * 1/ODR
STATIONARY	Enable stationary detection / motion detection with no automatic ODR change when detecting stationary state. Default value: 0 (0: disabled; 1: enabled)
SLEEP_DUR[3:0]	Duration to go in sleep mode. Default value is SLEEP_DUR[3:0] = 0000 (which is 16 * 1/ODR). 1 LSB = 512 * 1/ODR

8.25 FREE_FALL (36h)

Free-fall duration and threshold configuration register (r/w).

Table 70. FREE_FALL register

Table 90. CTRL7 register description

DRDY_PULSED	Switches between latched and pulsed mode for data ready interrupt. (0: latched mode is used; 1: pulsed mode enabled for data-ready)
INT2_ON_INT1	Signal routing. (1: all signals available only on INT2 are routed on INT1)
INTERRUPTS_ENABLE	Enable interrupts.
USR_OFF_ON_OUT	Enable application of user offset value on XL output data registers. FDS bit in CTRL6 (25h) must be set to '0'-logic (low-pass path selected).
USR_OFF_ON_WU	Enable application of user offset value on XL data for wakeup function only.
USR_OFF_W	Selects the weight of the user offset words specified by X_OFS_USR_[7:0], Y_OFS_USR_[7:0] and Z_OFS_USR_[7:0] bits. (0: 977 µg/LSB; 1: 15.6 mg/LSB)
HP_REF_MODE	High-pass filter reference mode enable. (0: high-pass filter reference mode disabled (default); 1: high-pass filter reference mode enabled)
LPASS_ON6D	(0: ODR/2 low pass filtered data sent to 6D interrupt function (default); 1: LPF2 output data sent to 6D interrupt function)

9 Package information

In order to meet environmental requirements, ST offers these devices in different grades of **ECOPACK** packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com. ECOPACK is an ST trademark.

9.1 Soldering information

The LGA package is compliant with the ECOPACK[®], RoHS and “Green” standard. It is qualified for soldering heat resistance according to JEDEC J-STD-020. Land pattern and soldering recommendations are available at www.st.com.

9.2 LGA-12 package information

Figure 18. LGA-12 2.0 x 2.0 x 0.7 mm package outline and mechanical data

Note : coplanarity of package terminals : 0.1mm

Dimensions are in millimeter unless otherwise specified
General Tolerance is ± 0.15 mm unless otherwise specified

OUTER DIMENSIONS

ITEM	DIMENSION [mm]	TOLERANCE [mm]
Length [L]	2	± 0.1
Width [W]	2	± 0.1
Height [H]	0.7 MAX	/

DM00170568_2

9.3 LGA-12 packing information

Figure 19. Carrier tape information for LGA-12 package

NOTES:

1. 10 SPROCKET HOLE PITCH CUMULATIVE TOLERANCE ± 0.2
2. POCKET POSITION RELATIVE TO SPROCKET HOLE MEASURED AS TRUE POSITION OF POCKET, NOT POCKET HOLE.
3. Ao AND Bo ARE CALCULATED ON A PLANE AT A DISTANCE "R" ABOVE THE BOTTOM OF THE POCKET.

Figure 20. LGA-12 package orientation in carrier tape
