

## 400 mA nano-quiescent synchronous step-down converter with digital voltage selection, Power Good and AUX switch

TQFN12 (2.0x1.7 mm)

### Features

- 500 nA input quiescent current at  $V_{IN} = 3.6$  V (not switching)
- 92% typical efficiency at 10 mA load ( $V_{IN} = 3.6$  V,  $V_{OUT} = 2.5$  V)
- 100% duty cycle
- 1.8 V to 5.5 V input operating range
- Undervoltage lockout: 1.57 V ( $V_{IN}$  falling, typ.)
- Up to 400 mA output current capability
- Low power control operation for the best efficiency
- Embedded soft-start circuit
- Tiny external components:  $L = 2.2 \mu H$  typ.
- Settable inductor current limitation
- Selectable output voltages: 1.0 V to 3.3 V
- Output voltage Power Good
- $\pm 1.5\%$  output voltage accuracy ( $V_{OUT}$ ,  $T_A = 25^\circ C$ )
- Dynamic output voltage selection (D0, D1 and D2)
- Auxiliary load switch  $V_{out2}$  (AUX control input)
- Available in TQFN12 package

### Applications

#### Product status link

ST1PS02

- Wearable applications
- Personal tracking monitors
- Smart watches, sport bands
- Energy harvesting, wireless sensors
- Wearable and fitness accessories
- Industrial sensors, portable low power devices
- Single cell Li-Ion battery applications
- Bluetooth® low energy
- Zigbee

### Description

The ST1PS02 is a nano-quiescent miniaturized synchronous step-down converter, which is able to provide up to 400 mA output current with an input voltage ranging from 1.8 V to 5.5 V. This converter is specifically designed for applications where high efficiency, PCB size and thickness are the key factors. The output voltage can be set using three digital control inputs, a  $V_{OUT}$  from 1.0 V to 3.3 V can be dynamically selected. Thanks to the enhanced PCC (peak current control) the ST1PS02 reaches very high efficiency conversion using just a 2.2  $\mu H$  inductor and two small capacitors. The device embeds a controlled load switch to supply a subsystem with same voltage rail. Advanced design circuitry is implemented to minimize the quiescent current. The device is available in thin plastic package.

## 1 Application schematic

Figure 1. ST1PS02 application schematic

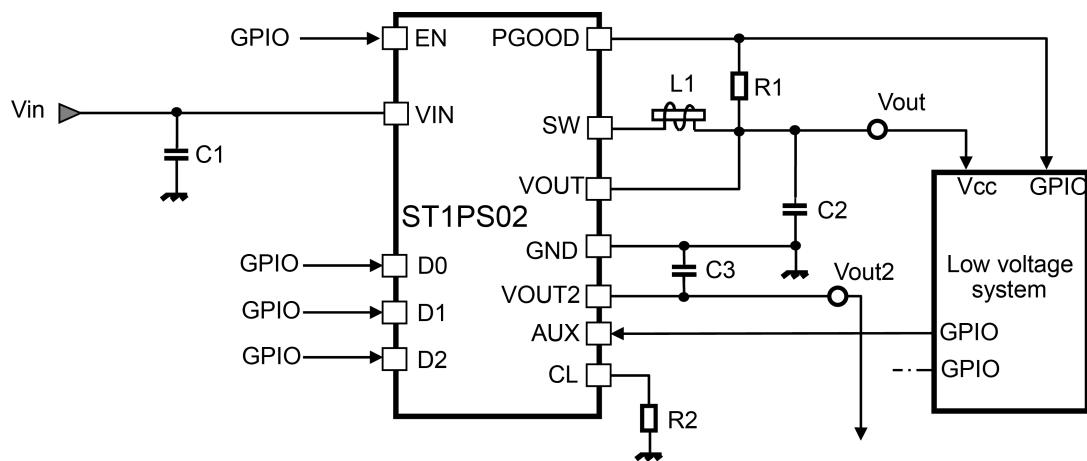

Table 1. Typical external components

Component	Description	Value	Size - imperial (metric)
C <sub>1</sub>	Ceramic capacitor with low ESR values	10 µF	0603 (1608)
C <sub>2</sub> , C <sub>3</sub>	Ceramic capacitor with low ESR values		
L <sub>1</sub>	Inductor	2.2 µH	0806 (2016)
R <sub>1</sub>	Pull-up resistor	1 MΩ	
R <sub>2</sub>	Current limit resistor	0 Ω	0402 (1005)

## 2 Pin configuration

Figure 2. TQFN12 package (top through view)

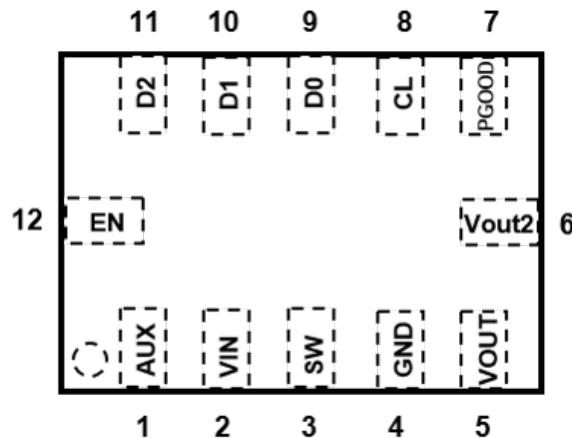

Table 2. Pin description

Name	Bump name	Description
AUX	1	Enable for the auxiliary output voltage
VIN	2	Input supply voltage. Bypass this pin to ground with a 10 $\mu$ F capacitor
SW	3	Switching output. Inductor connection
GND	4	Ground
VOUT	5	Sense pin used to monitor output voltage
Vout2	6	Auxiliary output pin with OCP (100 mA max. load)
PGOOD	7	Open drain output. It is in high impedance when the output voltage reaches 97.5% of the target $V_{OUT}$
CL	8	Current limit set. Connect to GND sets the default value (750 mA min.). An external resistor connected to GND can be used to adjust this parameter with a lower value (resistor values are reported on <a href="#">Table 6. Electrical characteristics</a> )
D0	9	
D1	10	Output voltage selection inputs ( refer to <a href="#">Table 7. Output voltage settings</a> )
D2	11	
EN	12	Enable pin. High logic level turns on the IC

## 3 Functional pin description

### **GND**

Device ground pin.

### **VIN**

Supply voltage. This pin supplies power to the internal analog and digital circuitries when voltage is higher than  $V_{UVLO}$ . Bypass this pin to GND with a 10  $\mu$ F ceramic capacitor. Input capacitor  $C_1$  must be chosen with low ESR to reduce the input voltage ripple.

### **SW**

Inductor connection to internal PMOS and NMOS switches.

### **VOUT**

Output voltage sense input. It provides the feedback voltage level to the regulation circuitry. 10  $\mu$ F output capacitor  $C_2$  must be connected close to the pin or through a short trace and should have low ESR to reduce the output voltage ripple.

### **EN**

Enable pin. A logic low level on this pin disables the device. High level enables the device. Do not leave this pin floating.

### **D0, D1, D2**

Output voltage selection pins. See [Table 7. Output voltage settings](#) for  $V_{OUT}$  selection. Do not leave these pins floating. These pins can be dynamically changed during operation.

### **PGOOD**

Power Good open drain output. If used it requires a pull-up resistor to hold a high level signal. High impedance indicates that  $V_{OUT}$  is above proper good threshold.

### **AUX**

Load switch selection pins.  $V_{out2}$  output is activated when this pin is at high level. Held to ground if auxiliary output ( $V_{out2}$ ) is not used or if it should be disabled.

### **Vout2**

Auxiliary output. It provides the same regulated voltage level as main output ( $V_{OUT}$ ) less drop on the load switch circuitry. 10  $\mu$ F output capacitor  $C_3$  must be connected close to the pin or through a short trace and should have low ESR to reduce the output voltage ripple. This output is controlled from a soft-start circuit, if unused can be left open.

### **CL**

Current limit threshold input. Held to ground if not used and default current limitation is the proper value. For smaller current values a pull-down resistor must be used.

## 4 Maximum ratings

**Table 3. Absolute maximum ratings**

Symbol	Parameter	Value	Unit
$V_{IN}$	Power and signal supply voltage	- 0.3 to + 6.5	V
EN, D0, D1, D2, AUX	Logic input pins	- 0.3 to + 6.5	V
CL	Current limitation input pin	- 0.3 to + 6.5	V
$V_{OUT}, SW$	Output signal monitoring and switching pins	-0.3 to $V_{IN} + 0.3$	V
Vout2	Load switch output pin	- 0.3 to + 6.5	V
PGOOD	Power Good open drain output pin	- 0.3 to + 6.5	V
$T_{AMB}$	Operating ambient temperature	-40 to 85	°C
$T_J$	Junction temperature	-40 to 125	°C
$T_{STG}$	Storage temperature	-55 to 150	°C

**Note:** *Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied*

**Table 4. Thermal data**

Symbol	Parameter	TQFN12	Unit
$R_{thJA}$	Thermal resistance junction-ambient	75	°C/W

**Table 5. Recommended operating conditions**

Symbol	Parameter	Min.	Typ.	Max.	Unit
$V_{IN}$	Input supply voltage	1.8		5.5	V

## 5 Electrical characteristics

$C_1 = 10 \mu F$ ,  $C_2 = 10 \mu F$ ,  $C_3 = 10 \mu F$ ,  $L_1 = 2.2 \mu H$ ,  $R_1 = 1 M\Omega$ ,  $R_2 = 0 \Omega$ ,  $V_{IN} = 3.6 V$ ,  $V_{EN} = V_{IN}$ ,  $V_{OUT} = 1.8 V$ ,  $T_A = 25^\circ C$  unless otherwise specified.

## 7

# Operation description

The ST1PS02 is an ultra-low quiescent new generation buck converter. It targets a very small quiescent current consumption (typical 500 nA) and it guarantees high efficiency operation even down to few microampere loads. It is based on a hysteretic comparator that senses the coil ripple current that is held constant in all operation modes. The device has seamless transition between PFM (pulse frequency modulation) and PWM (pulse width modulation) mode with low ripple and good load transient response. In order to maintain constant ripple current on the selected coil, the device changes switching frequency, which also depends on input supply voltage. During PWM mode (heavy load), the device operates in continuous conduction up to 400 mA and switching frequency can reach 2 MHz maximum.

## 7.1

### Power save mode

At light load the device enters automatically power save mode with total current consumption from the input power supply of 500 nA typical; during this condition most of the internal blocks are turned off in order to reach ultra-low power consumption. During this time, the load current is supported by the output capacitor.

## 7.2

### Output voltage

The device allows the output voltage selection without an external resistor divider. Standard digital inputs are used to configure the device to supply a fixed output voltage according to [Table 7. Output voltage settings](#). The V<sub>OUT</sub> pin must be connected directly and as close as possible to the inductor terminal to obtain the best performance and get the best output voltage regulation. The output voltage can be dynamically changed to implement voltage scaling.

## 7.3

### Output discharge and UVLO

The device embeds a fast output discharge circuitry active when the enable pin is held to ground (EN=gnd) or when the input supply voltage reaches the minimum voltage level set by the UVLO protection circuit (undervoltage lock-out protection circuit). The UVLO rising threshold at 1.63 V (typ.) guarantees a proper device supply voltage operation. The output discharge function is available for the ST1PS02xQTR versions.

## 7.4

### Soft-start and current limitation

The device embeds a fixed soft-start circuit active during a limited time period (few ms). This feature allows the inrush current to be minimized from the power supply in case of weak source. During this period internal circuit reduces to 280 mA the typical switch current limit.

## 7.5

### 100% duty cycle operation

The device enters 100% duty cycle operation if the input voltage comes close to the selected output voltage. During this mode, the regulator is turned off and output pin is directly connected to the input pin through the high-side MOSFET. The output voltage follows the input level minus the voltage drop across the internal MOSFET and the inductor. Once the input voltage exceeds the 100% duty cycle leave threshold, the device restarts to switch and regulates the select output voltage again.

## 7.6

### Auxiliary output (Vout2)

The Aux pin controls Vout2 output. It provides the same regulated voltage level as the main output (V<sub>OUT</sub>) less drop on the load switch circuitry, when Aux pin tied high. The Vout2 pin allows connecting/disconnecting the other system load to the output of the ST1PS02.

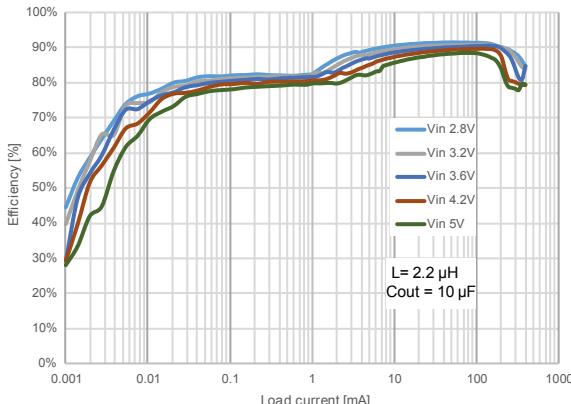

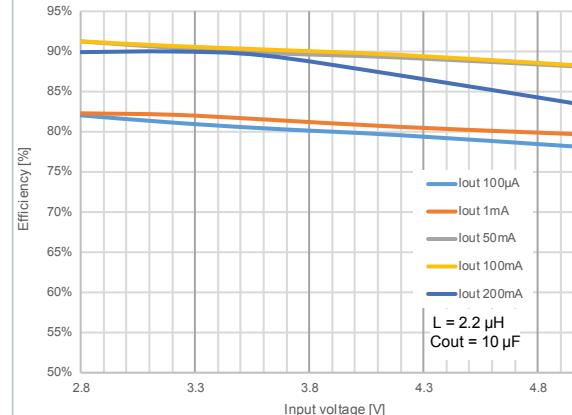

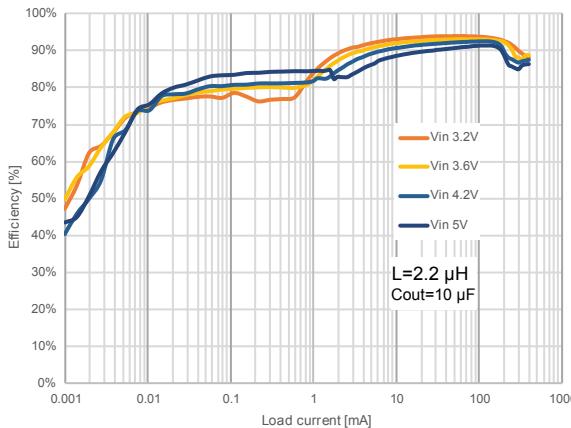

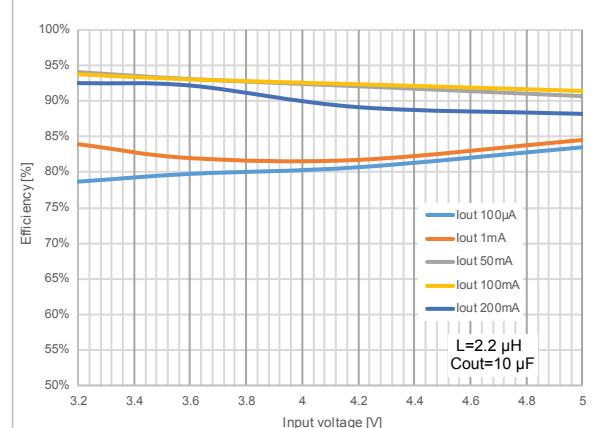

## 7.7

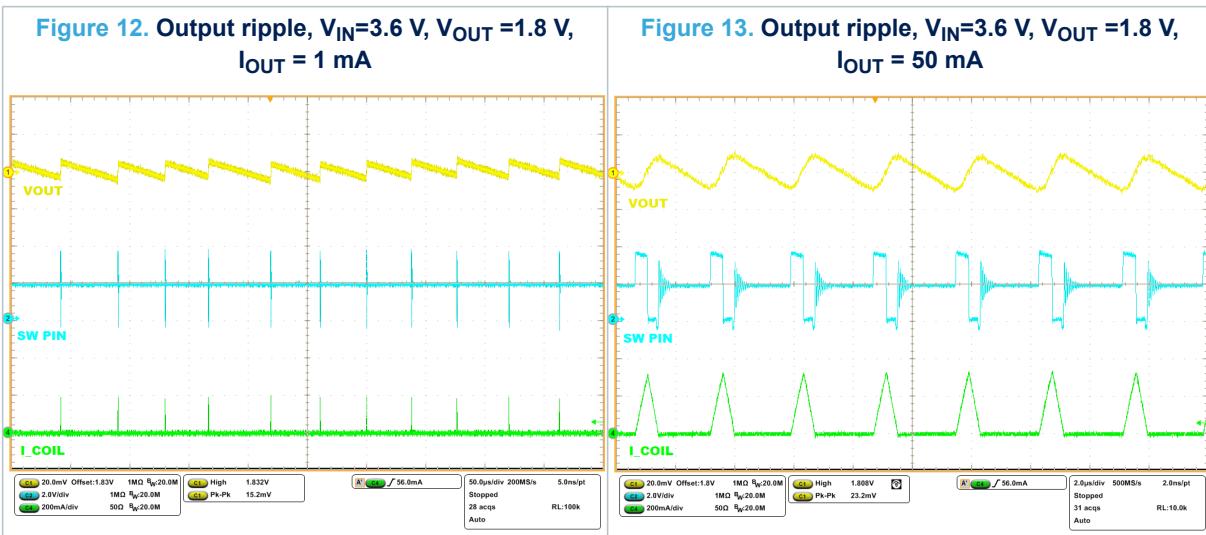

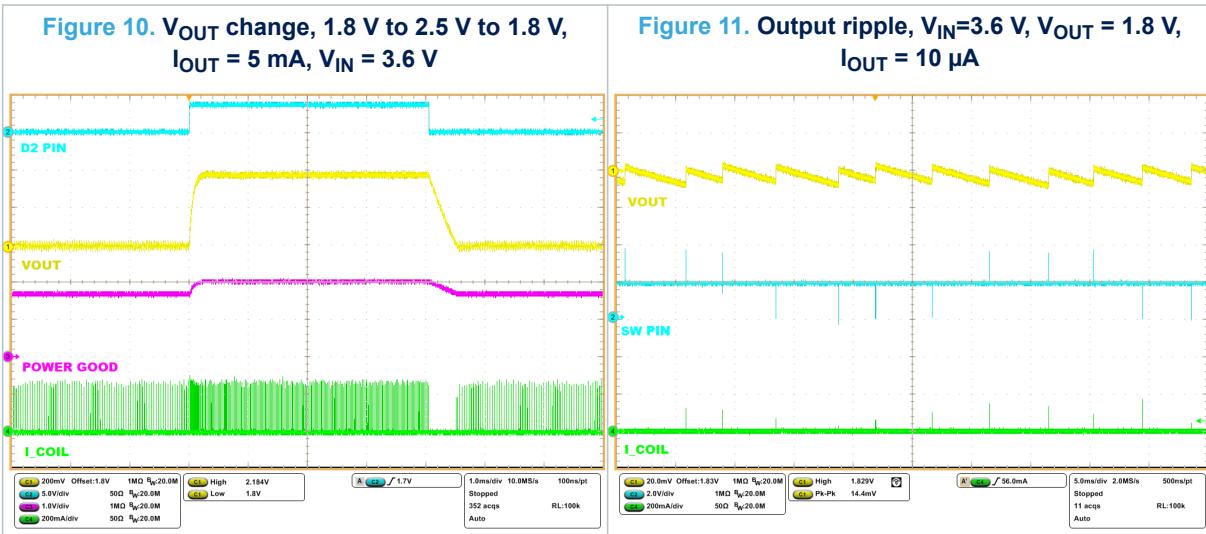

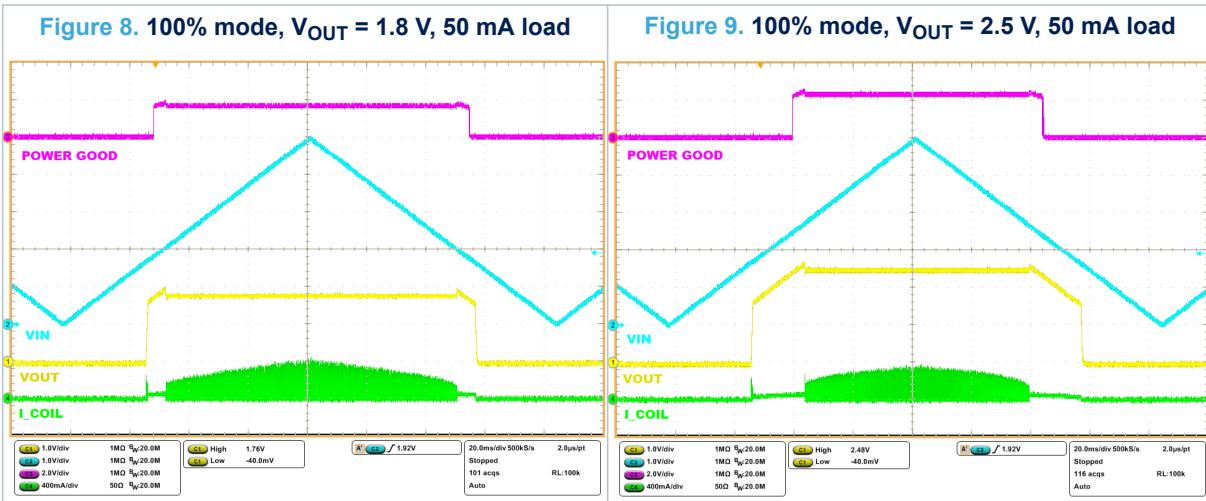

### Power Good flag

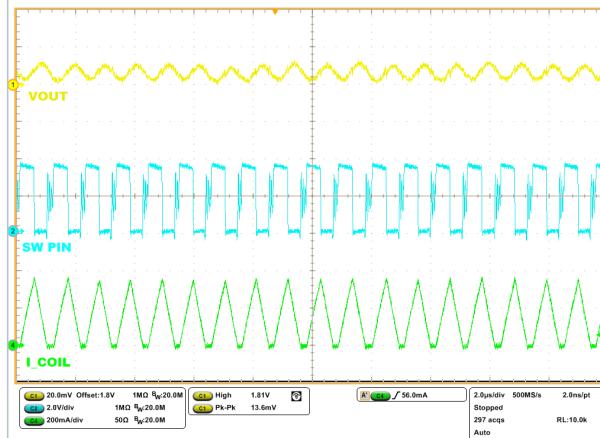

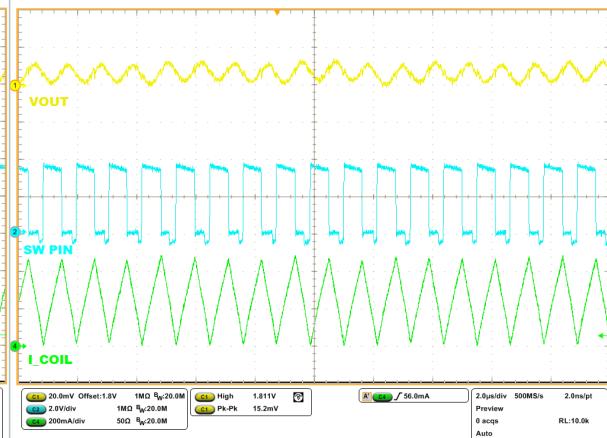

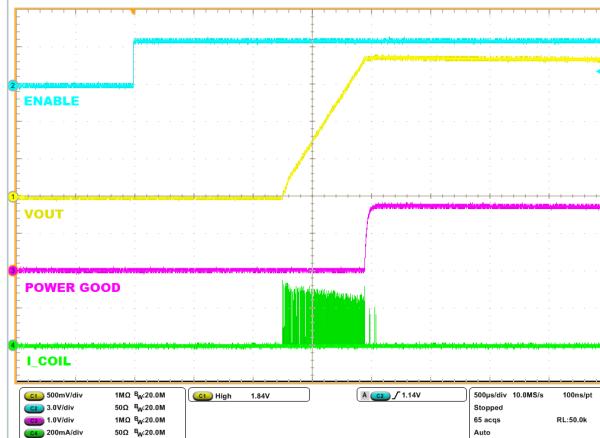

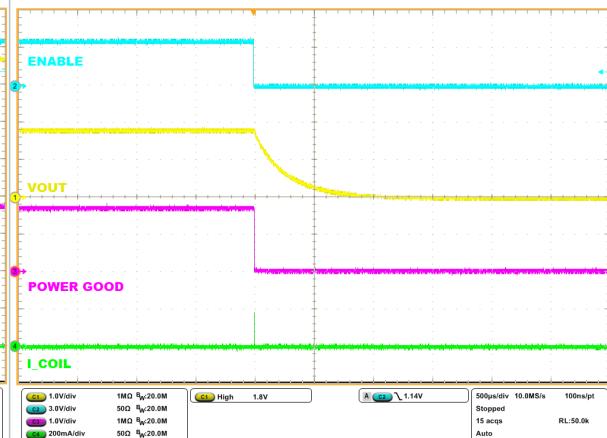

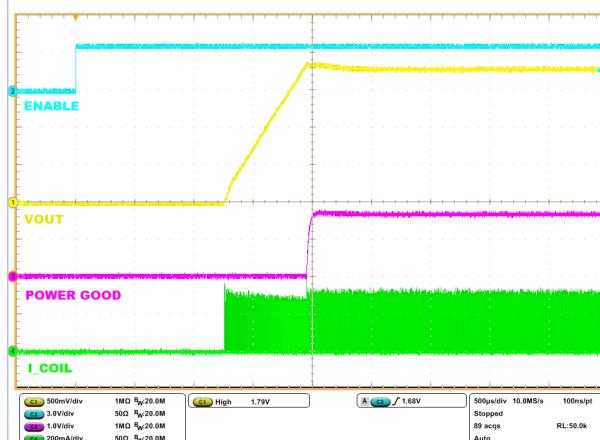

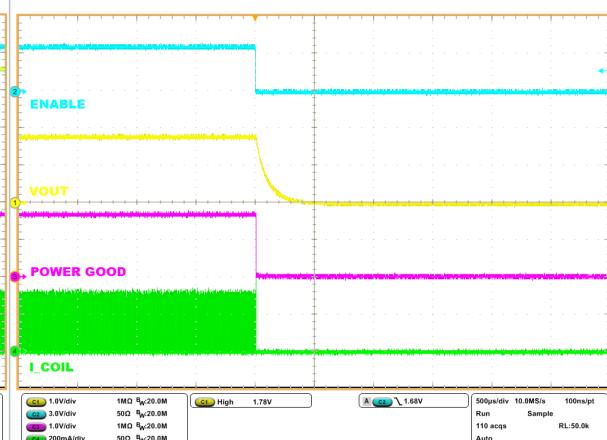

The Power Good comparator monitors the selected V<sub>OUT</sub> voltage. The Power Good open drain output is in high impedance when the V<sub>OUT</sub> reaches the correct voltage level while it switches to low level when V<sub>OUT</sub> falls below the normal voltage level.

**IMPORTANT NOTICE – PLEASE READ CAREFULLY**

STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, enhancements, modifications, and improvements to ST products and/or to this document at any time without notice. Purchasers should obtain the latest relevant information on ST products before placing orders. ST products are sold pursuant to ST's terms and conditions of sale in place at the time of order acknowledgement.

Purchasers are solely responsible for the choice, selection, and use of ST products and ST assumes no liability for application assistance or the design of Purchasers' products.

No license, express or implied, to any intellectual property right is granted by ST herein.

Resale of ST products with provisions different from the information set forth herein shall void any warranty granted by ST for such product.

ST and the ST logo are trademarks of ST. For additional information about ST trademarks, please refer to [www.st.com/trademarks](http://www.st.com/trademarks). All other product or service names are the property of their respective owners.

Information in this document supersedes and replaces information previously supplied in any prior versions of this document.
