

UDP SiM3L1xx Non-LCD MCU Card User's Guide

1. Introduction

The Unified Development Platform (UDP) provides a development and demonstration platform for Silicon Laboratories microcontrollers, short-range wireless devices, and software tools, including the Silicon Laboratories Integrated Development Environment (IDE).

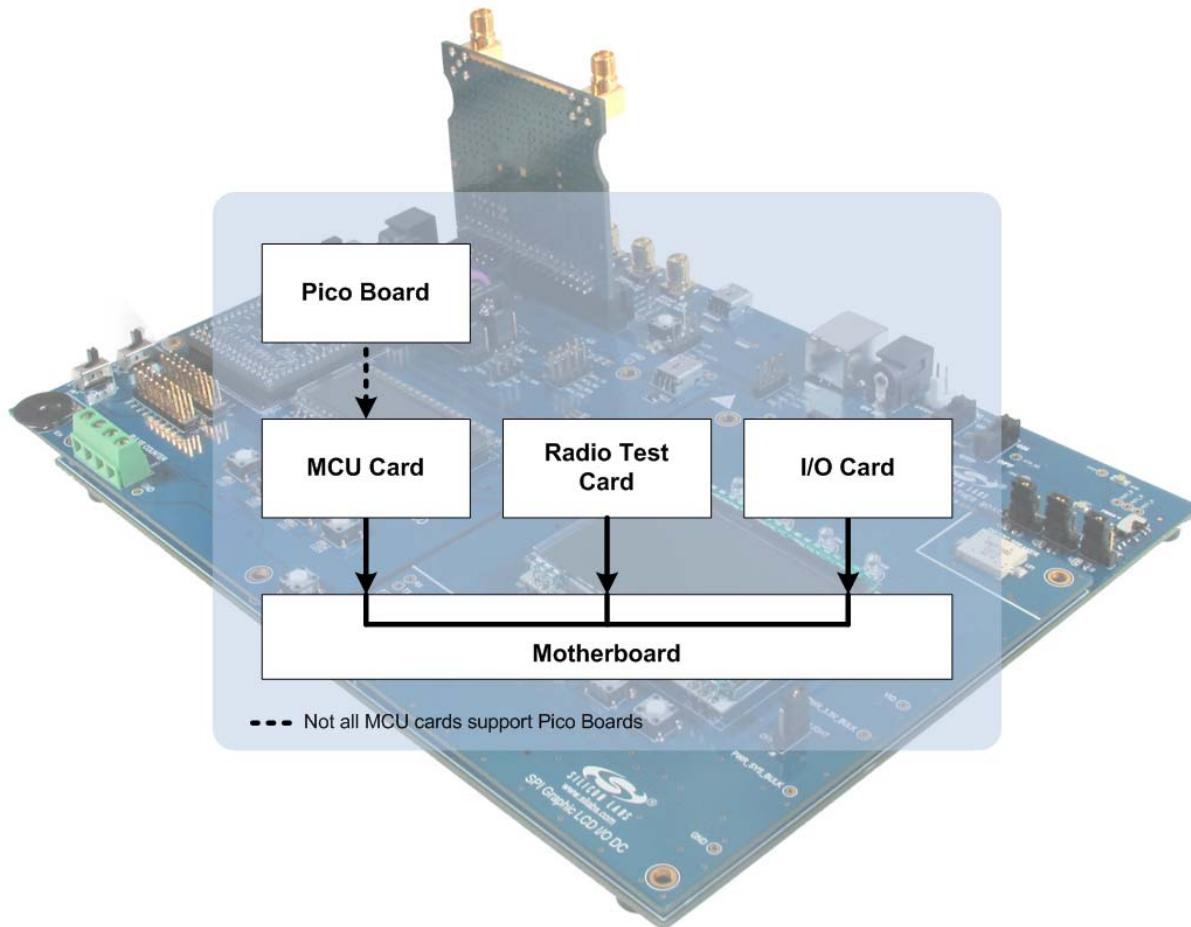

Figure 1. Unified Development Platform Block Diagram

2. Relevant Documents

This document provides a hardware overview for the Unified Development Platform (UDP) system SiM3L1xx non-LCD MCU card. Additional information on the UDP system and the Precision32™ MCUs can be found in the documents listed in this section.

2.1. Motherboard User's Guide

The UDP Motherboard User's Guide contains information on the motherboard features and can be found at www.silabs.com/udp.

2.2. Card User's Guides

The UDP MCU, I/O, and radio test card user's guides can be found at www.silabs.com/udp.

2.3. Application Notes

All Precision32 Application Notes can be found at www.silabs.com/32bit-appnotes.

3. Hardware Setup

3.1. Using the MCU Card Alone

Refer to Figure 2 for a diagram of the hardware configuration when using the MCU card without a UDP motherboard.

1. Connect the USB Debug Adapter to the 10-pin debug connector (J14) on the MCU card using the 10-pin ribbon cable.
2. Connect the USB Debug Adapter to a USB Port on the PC.
3. Move the SW2 VBAT Select switch to the middle **+3.3V_VREG** position.
4. Verify that the J14 Imeasure jumper is populated.
5. Verify that the VIO and VIORF Selection switches (SW8 and SW9) are in the lower position selecting **VBAT** as the supply voltage for the VIO and VIORF power rails.
6. Power the MCU card through the power connector (J6) using the supplied 9 V ac/dc adapter.

Notes:

- Use the Reset button in the IDE to reset the target when connected using a USB Debug Adapter.
- Remove power from the MCU card and the USB Debug Adapter before connecting or disconnecting the ribbon cable from the MCU card. Connecting or disconnecting the cable when the devices have power can damage the device and/or the USB Debug Adapter.

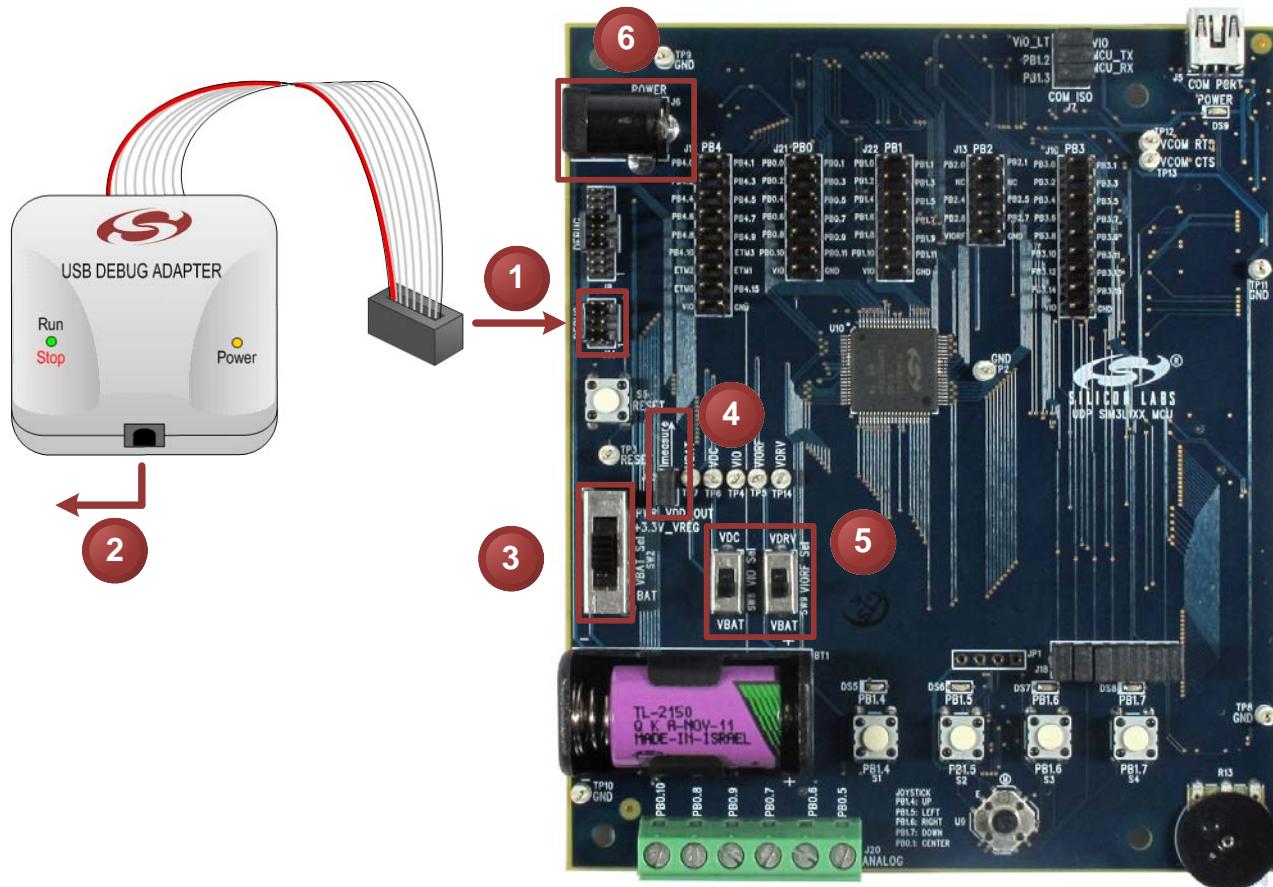

Figure 2. Hardware Setup using the MCU Card Alone

SiM3L1xx Non-LCD UG

3.2. Using the MCU Card with the UDP Motherboard

Refer to Figure 3 for a diagram of the hardware configuration when using the MCU card with a UDP motherboard.

1. Connect the MCU card to the UDP motherboard slot.
2. (Optional) Connect an I/O card to the UDP motherboard slot.
3. (Optional) Connect a radio test card to the radio test card slot in the UDP motherboard.
4. (Optional) Connect an EZLink card to the EZLink card slot in the UDP motherboard.
5. Connect the USB Debug Adapter to the 10-pin debug connector (J31) on the MCU card using the 10-pin ribbon cable.
6. Connect the USB Debug Adapter to a USB Port on the PC.
7. Move the SW2 VBAT Select switch to the upper **PWR_VDD_OUT** position.
8. Verify that the J14 lmeasure jumper is populated.
9. Verify that the VIO and VIORF Selection switches (SW8 and SW9) are in the lower position selecting **VBAT** as the supply voltage for the VIO and VIORF power rails.
10. Connect the ac/dc power adapter to power jack J20 on the UDP motherboard. The board can also be powered from the J16 USB, J1 mini USB connectors, or J11 battery connector socket.
11. Move the S3 power switch on the UDP motherboard to the ON position.
12. Update the motherboard firmware as described in Section 3.4.

Notes:

- Use the Reset button in the IDE to reset the target when connected using a USB Debug Adapter.
- Remove power from the target board and the USB Debug Adapter before connecting or disconnecting the ribbon cable from the target board. Connecting or disconnecting the cable when the devices have power can damage the device and/or the USB Debug Adapter.
- The MCU card can be used alone without the motherboard. However, the motherboard must be powered if an MCU card is connected.

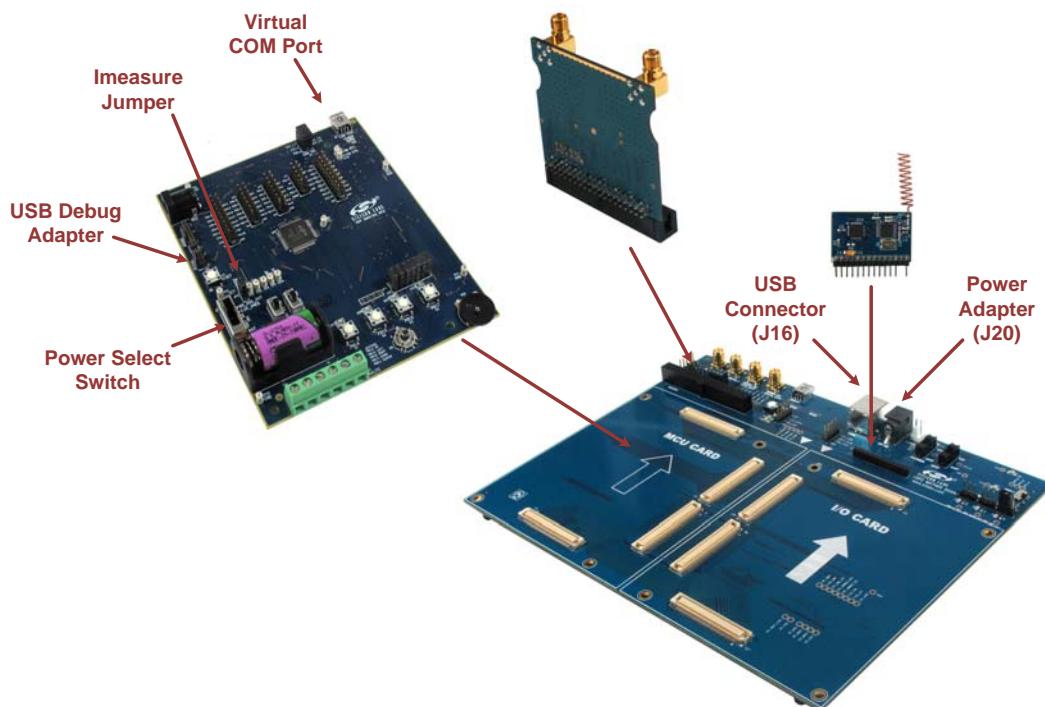

Figure 3. Hardware Setup using the Unified Development Platform

3.3. CP210x USB to UART VCP Driver Installation

The MCU Card includes a Silicon Labs CP210x USB-to-UART Bridge Controller. Device drivers for the CP210x need to be installed before the PC software can communicate with the MCU through the UART interface. If the "Install CP210x Drivers" option is selected during installation, a driver "unpacker" utility will launch.

1. Follow the steps to copy the driver files to the desired location. The default directory is C:\SiLabs\MCU\CP210x.
2. The final window will give an option to install the driver on the target system. Select the "Launch the CP210x VCP Driver Installer" option if you are ready to install the driver.
3. If selected, the driver installer will now launch, providing an option to specify the driver installation location. After pressing the "Install" button, the installer will search your system for copies of previously installed CP210x Virtual COM Port drivers. It will let you know when your system is up to date. The driver files included in this installation have been certified by Microsoft.
4. If the "Launch the CP210x VCP Driver Installer" option was not selected in step 3, the installer can be found in the location specified in step 2, by default C:\SiLabs\MCU\CP210x\Windows_2K_XP_S2K3_Vista. At this location, run CP210xVCPInstaller.exe.
5. To complete the installation process, connect the included USB cable between the host computer and the COM PORT USB connector (J5) on the MCU Card. Windows will automatically finish the driver installation. Information windows will pop up from the taskbar to show the installation progress.
6. If needed, the driver files can be uninstalled by selecting "Silicon Labs CP210x USB to UART Bridge Driver Removal" option in the "Add or Remove Programs" window.

3.4. Updating the UDP Motherboard Firmware

To ensure the UDP Motherboard supports the SIM3L1xx MCU card, run the UDP Motherboard Firmware Update Utility shown in Figure 4. This utility can be downloaded from www.silabs.com/udp.

1. Connect the UDP motherboard to a PC using a regular USB cable connected to the UDS connector (J16).
2. Run the utility.
3. Select the desired motherboard if more than one is connected to the PC.
4. Press the **Update Selected Device** button.

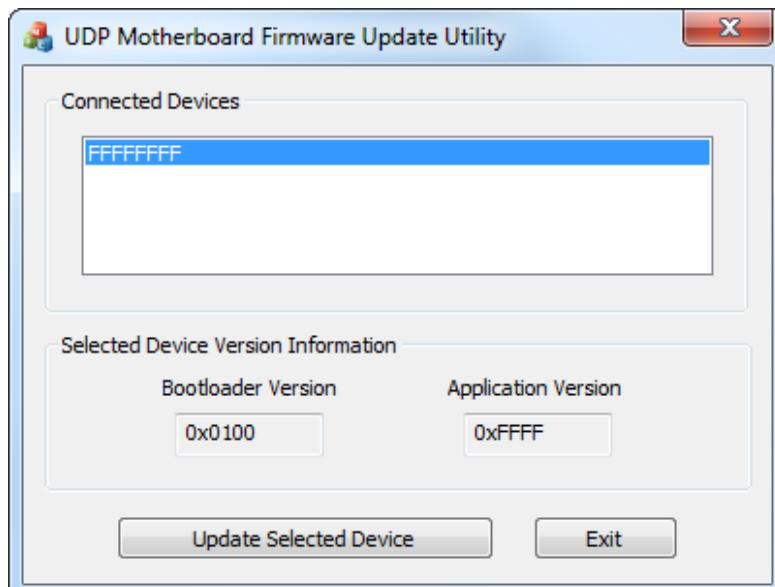

Figure 4. UDP Motherboard Firmware Update Utility

SiM3L1xx Non-LCD UG

4. SiM3L1xx Non-LCD MCU Card Overview

The SiM3L1xx non-LCD MCU card enables application development on the SiM3L1xx MCU. The card connects to the MCU card expansion slot on the UDP motherboard and provides complete access to the MCU resources. Each expansion board has a unique ID that can be read out of an EEPROM or MCU on the board, which enables software tools to recognize the connected hardware and automatically select the appropriate firmware image. The target MCU card can also be detached from the UDP and used alone as a development or demonstration tool.

Figure 5 shows the SiM3L1xx non-LCD MCU card, and Figure 6 highlights the SiM3L1xx non-LCD MCU card features.

Figure 5. SiM3L1xx Non-LCD MCU Card

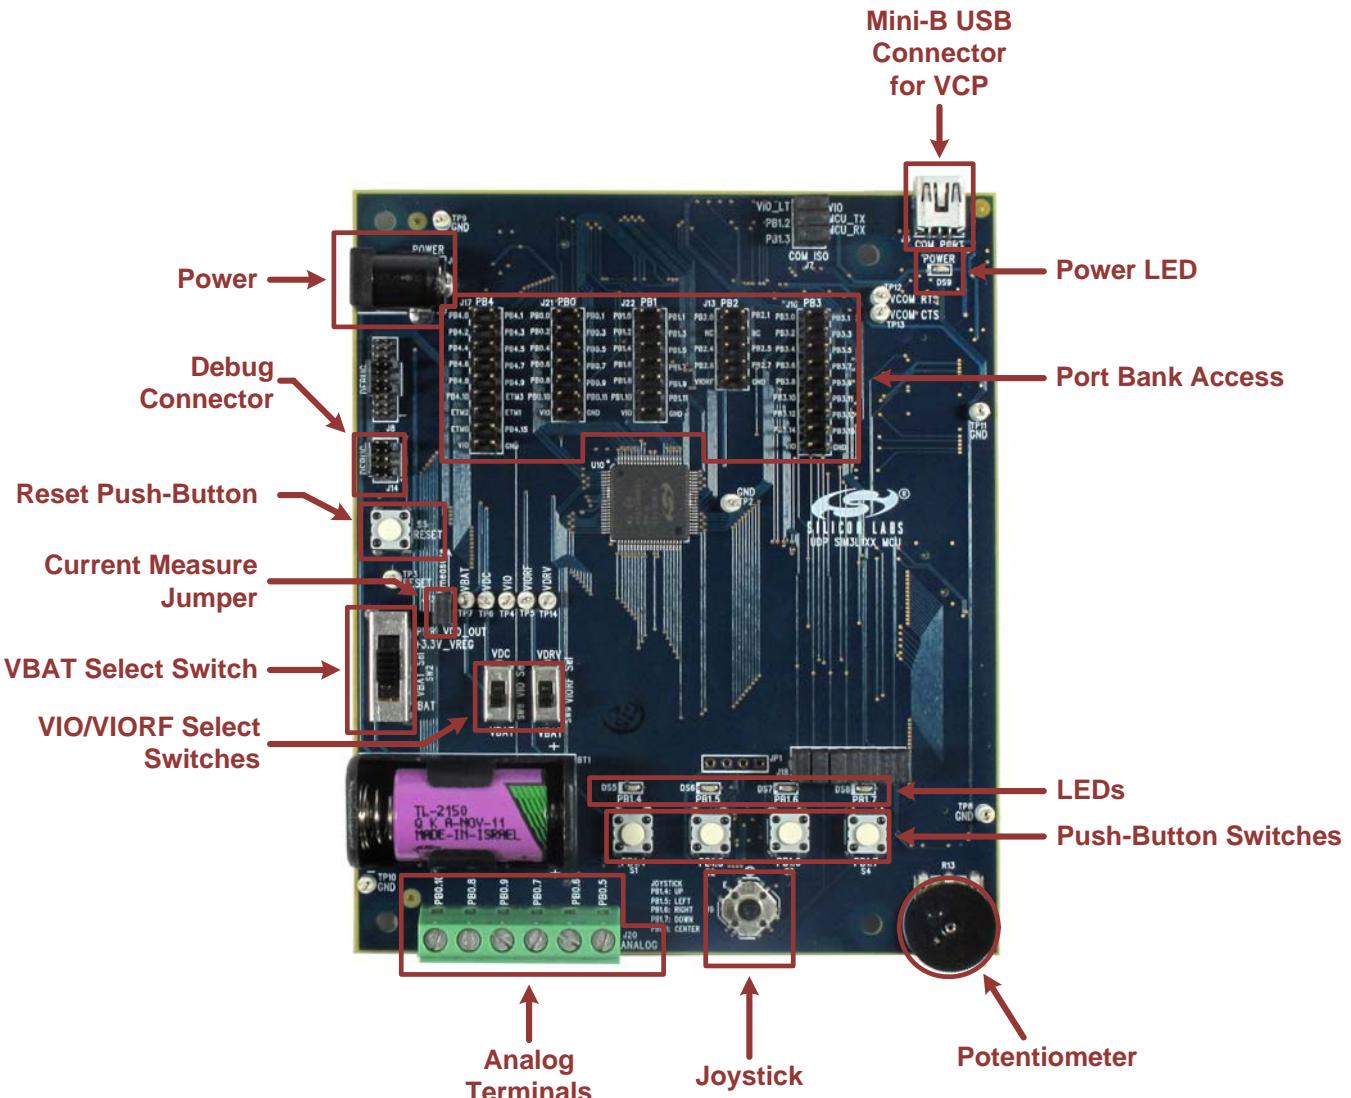

Figure 6. SiM3L1xx non-LCD MCU Card Features

SiM3L1xx Non-LCD UG

4.1. Push-Button Switches and LEDs (S1-4, DS5-8)

The UDP SiM3L1xx non-LCD MCU Card has four push-button switches and four LEDs. The four switches and LEDs connect to PB1.4, PB1.5, PB1.6, and PB1.7. The switches are normally open and pull the pin voltage to ground when pressed. The LEDs connect to VIO through a current-limiting resistor and turn on when the corresponding Port Bank pin is low.

A 5-way joystick is also connected to PB1.4, PB1.5, PB1.6, and PB1.7. Selecting one of the directions in the joystick has the same effect as pressing the push button switch. Pressing down on the joystick will connect PB0.1 to ground.

The header J18 can be used to disconnect the switches, LEDs, and joystick from the GPIO pins.

Table 1. Switch and LED Pin Descriptions

MCU Pin	Function		
	LEDs	Joystick	Switch
PB0.1	—	CENTER	—
PB1.4	Red LED DS5	UP	Switch S1
PB1.5	Red LED DS6	RIGHT	Switch S2
PB1.6	Red LED DS7	DOWN	Switch S3
PB1.7	Red LED DS8	LEFT	Switch S4

4.2. Analog Terminals (J20)

Several of the SiM3L1xx port pins used for analog functions are connected to the J20 terminal block. Refer to Table 2 for the J20 terminal block connections.

Table 2. Terminal Block Pin Descriptions (J20)

Terminal Pin	MCU I/O
1	PB0.5 / PC0
2	PB0.6 / PC1
3	PB0.7 / LC0
4	PB0.8 / LC1
5	PB0.9 / LCPUL0
6	PB0.10 / LCPUL1

4.3. Potentiometer (R13)

The potentiometer is available on PB0.3. To facilitate a low-power potentiometer, PB0.4 connects to the bottom of the potentiometer as a potentiometer enable. To use the potentiometer, install a shorting block on J18 pins 11 and 12 to connect PB0.3 to the potentiometer and J18 pins 13 and 14 to connect the potentiometer enable to PB0.4. Drive PB0.4 low to enable the potentiometer.

4.4. VBAT Power Select Switch (SW2)

The VBAT Power Supply has three power options: UDP motherboard (PWR_VDD_OUT), +3.3 V Regulator Power, and Battery Power. The VBAT Power Select Switch is used to select between the three options. The +3.3 V Regulator power option allows the board to be powered from a diode-OR of three power sources: 9 V Power Adapter (J6), the USB connector labeled "COM PORT" (J5), or from the UDP motherboard bulk supply.

4.5. Power LED (DS9)

The blue power LED provides visual feedback when the board is powered through USB, the 9 V power adapter, or from the UDP Motherboard. The power LED indicates that power is available on the board and the VBAT, VIO, and VIORF switches must be configured properly to power the MCU.

4.6. Battery Holder (BT1)

The battery holder is designed to accept a 3.6 V lithium thionyl chloride battery. The VBAT Power Select Switch may be used to power the system from the battery. The Power LED does not turn on when battery powered.

4.7. Imeasure Jumper (JP2)

The Imeasure jumper (JP2) allows for easy access to measure the VBAT current of the MCU. The shorting block for this header is populated by default. To measure the supply current, remove the corresponding shorting block and connect a current measurement device across the unpopulated header.

4.8. VIO and VIORF Selection Switches (SW8 and SW9)

The VIO and VIORF switches allow for the VIO and VIORF pins on the MCU to be connected to the VDC or the VBAT supply. By default, both switches will power VIO and VIORF from VBAT.

4.9. Debug Header (J14)

The mini 10-pin debug header supports the Silicon Labs USB Debug Adapter. This connector provides a Serial Wire (SW) debug connection to the SiM3L1xx on the MCU card.

4.10. Reset Button (S5)

The reset push-button switch is in the lower-left corner. Pushing this button will always reset the MCU. Note that pushing this button while the IDE is connected to the MCU will result in IDE disconnecting from the target.

4.11. UART VCP Connection Options (J7, U2, J5)

The MCU card features a USB virtual COM port (VCP) UART connection via the mini-B USB connector (J5) labeled "COM PORT." The VCP connection uses the CP210x USB-to-UART bridge chip (U2). The GPIO pins connected to the CP210x device can be enabled or disabled through the J7 header. Table 3 shows the GPIO pins that are routed to the CP210x.

Table 3. CP210x Controlled GPIO Pins

GPIO Pin	User Control Function
PB1.2	UART Transmit
PB1.3	UART Receive
VIO	VIO

4.12. Port Pin Headers (J21, J22, J13, J16, J17)

All of the MCU port pins are available on the 0.100-inch headers on MCU card. Some of these port pins are shared with other functions on the board and may be modified as explained in Section 4.13.

SiM3L1xx Non-LCD UG

4.13. MCU Card Default and Optional Connections

The MCU card has many default and optional connections for use with different I/O cards and the UDP motherboard. Some of the default connections are via shorting jumpers. The shorting jumpers are a 603 resistor footprint with a cut trace between pads. To disconnect, cut the trace with a sharp utility knife. To reconnect, install a $0\ \Omega$ 603 resistor or connect the two pads with solder. The optional connections are non-populated (no-pop) resistor footprints. To connect, install a $0\ \Omega$ 603 resistor or connect the two pads with solder.

The external LCD connections on the SiM3L1xx non-LCD MCU Card route to the UDP I/O Card.

Table 4. MCU Pin Functions

MCU Pin	MCU Card Function		
	Default		Optional
	External LCD	Other

5. Using the SiM3L1xx MCU Card with the UDP Motherboard

5.1. Current Measurement

The power measurement circuitry on the UDP motherboard consists of a Silicon Labs C8051F351 8051 MCU that measures both input voltage and current consumption of the MCU card, I/O expander, and radio test card. Install a shorting block on the UDP Motherboard J13 and J15 and connect the two left pins together when using the motherboard with the SiM3L1xx MCU card.

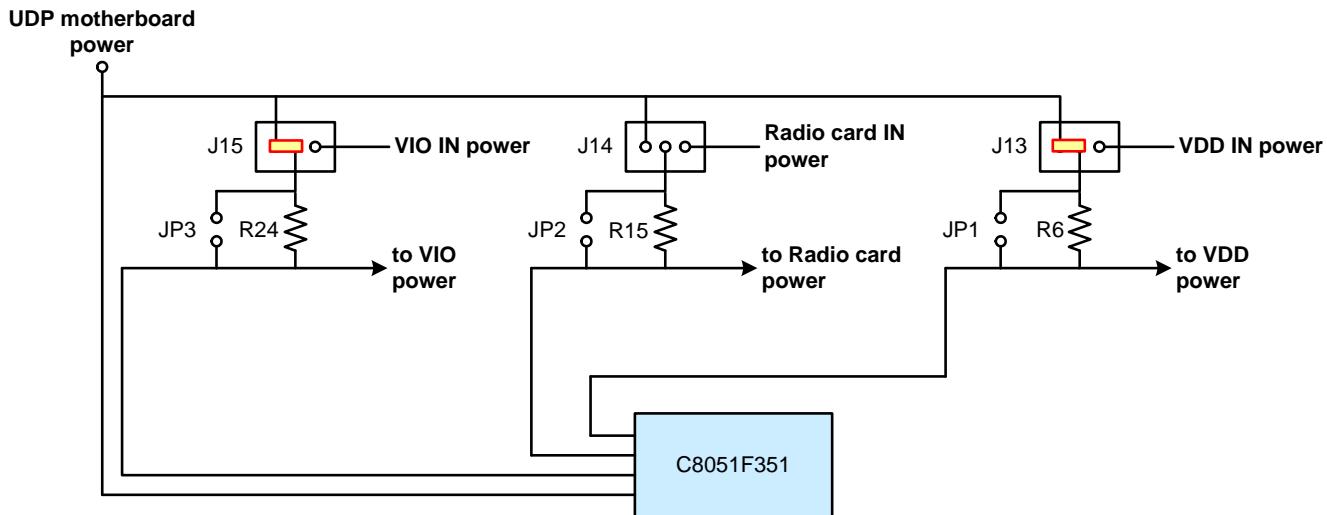

Figure 7. Power Measurement Diagram with Shorting Blocks

5.2. MCU Card Header Connections

The MCU card has four connectors with 100 pins each. These 400 pins are directly tied to the UDP motherboard and I/O cards. These signals are named and designed to support a wide variety of features and applications, and the SiM3L1xx Non-LCD UG card implements a subset of these connections.

The MCU cards and I/O cards are designed so that a maximum number of functions are shared between each card. This allows a particular type of I/O card to be shared amongst all MCU cards that connect to the same signals.

The MCU card slot includes the following components:

J1	MCU card connector H1
J2	MCU card connector H2
J3	MCU card connector H3
J4	MCU card connector H4

The SiM3L1xx Non-LCD UG card implements the signals described in Table 6, Table 7, Table 8, and Table 9 in the Appendix.

6. Shorting Blocks: Factory Defaults

The SiM3L1xx Non-LCD UG MCU card comes from the factory with pre-installed shorting blocks on several headers. Figure 8 shows the positions of the factory default shorting blocks.

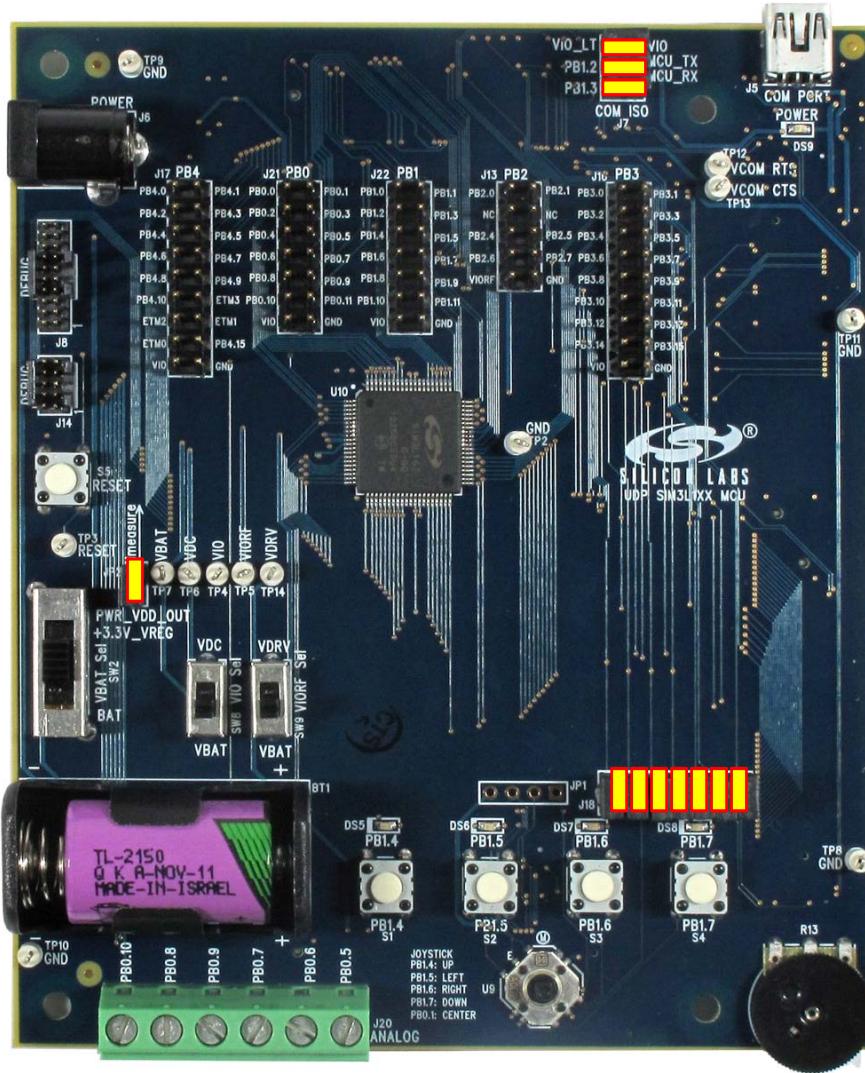

Figure 8. Shorting Blocks: Factory Defaults

A shorting block is installed across the J19 Imeasure header to enable power to the MCU. Shorting blocks are installed on J7 to enable the virtual COM port. Shorting blocks are also installed on J18 to enable the switches, LEDs, and potentiometer to be connected to GPIO pins.

DOCUMENT CHANGE LIST

Revision 0.1 to Revision 0.2

- Updated 3.1. "Using the MCU Card Alone," on page 3, Figure 2, Figure 6, and Figure 8 to show the correct VBAT Sel switch (SW2) position.
- Updated 3.2. "Using the MCU Card with the UDP Motherboard," on page 4 to show the correct VBAT Sel switch (SW2) position.

Patent Notice

Silicon Labs invests in research and development to help our customers differentiate in the market with innovative low-power, small size, analog-intensive mixed-signal solutions. Silicon Labs' extensive patent portfolio is a testament to our unique approach and world-class engineering team.

The information in this document is believed to be accurate in all respects at the time of publication but is subject to change without notice. Silicon Laboratories assumes no responsibility for errors and omissions, and disclaims responsibility for any consequences resulting from the use of information included herein. Additionally, Silicon Laboratories assumes no responsibility for the functioning of undescribed features or parameters. Silicon Laboratories reserves the right to make changes without further notice. Silicon Laboratories makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Silicon Laboratories assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. Silicon Laboratories products are not designed, intended, or authorized for use in applications intended to support or sustain life, or for any other application in which the failure of the Silicon Laboratories product could create a situation where personal injury or death may occur. Should Buyer purchase or use Silicon Laboratories products for any such unintended or unauthorized application, Buyer shall indemnify and hold Silicon Laboratories harmless against all claims and damages.
